*Germany.*—By the imperial constitution, April 16, 1871, the Prussian obligation to serve in the army is extended to the whole empire. Every German capable of bearing arms is bound to be in the standing army for 7 years, as a rule from the end of his 20th to the beginning of his 28th years. Of the 7 years, 3 must be in active service, and 4 in the reserve. Then he must serve for 5 years in the landwehr. The whole of the land forces of the empire form a united army, all the troops being bound unconditionally to obey the emperor in war and peace. The army of the German empire consists of 18 corps d'armée; viz., the corps d'armée of the guard, 13 Prussian corps d'armée (Nos. I.—XI., XIV.—comprising the troops of Baden— and XV.), the corps d'armée of Saxony (XII.), of Württemberg (XIII.), two of Bavaria (I. and II.), and the division of Hesse. In time of peace the German army has: (1) of infantry, 146 regiments of the line, 26 battalions of chasseurs, with 4687 commissioned and non-commissioned officers of the landwehr, amounting to 274,711 men; (2) cavalry, 93 regiments, containing 65,513 men; (3) artillery, 35 regiments of mounted, 13 of foot artillery, having 45,439 men; (4) engineers, 19 battalions, 9568 men. In all, with 2056 staff officers, military train, etc., 17,036 officers, 401,659 men. On the war-footing, this force is increased by the following additions: field troops, 16,976 officers, 676,486 men; depot troops, 4431 officers, 245,793 men; garrison troops, 9599 officers, 354,247 men. Total of the German army in time of war: 31,006 officers, and 1,276,526 men, with 287,746 horses. The maximum number of troops employed by Germany in the war with France was 1,350,787 men, and 263,735 horses.

*Austria.*—The military forces of the Austro-Hungarian empire are divided into the standing army, the landwehr, and the landsturm. Subjects of the empire are universally liable to service. The term of service is 10 years, 3 of which the soldier must spend in active service, being afterwards enrolled for 7 years in the army of reserve. He is still further liable to serve 2 years in the landwehr. The regiments of the standing army are under the control of the minister of war for the empire, while the landwehr is controlled by the Austrian and Hungarian ministers of national defense. The emperor-king is the supreme chief of the whole of the military and naval forces of the empire. The Austrian infantry constitutes 80 regiments of the line, with 148,480 men; the chasseurs, 40 battalions, with 21,451 men; of the cavalry there are 41 regiments (dragoons, hussars, lancers), 43,993 men; of artillery, 13 regiments of field artillery, and 12 battalions of fortress artillery—in all, 28,695 men. The engineers and pioneers make 3 regiments, 8898 men. The sanitary troops and military train have 5748 men. The miscellaneous establishments (schools, magazines, etc.) number 25,174. In all, for the active army in time of peace, 284,485 (of whom 253,513 are combatants). On the war-footing these numbers are thus augmented: infantry, 485,680; chasseurs, 59,340; cavalry, 58,671; artillery, 70,614; engineers, 24,502; sanitary troops and military train, 45,727. Then the Austrian landwehr (infantry, chasseurs, and cavalry) comprises 3669 men in peace, 145,045 in war; and the Hungarian landwehr (the Honveds) 13,591 in peace, and 206,707 in war. The total of the Austrian military forces in peace-time is therefore 301,695; in war, 1,137,401.

*Russia.*—According to a law of military reorganization, the Russian forces are to be raised by annual conscription, to which all are liable who have completed their 21st year, and are not physically incapacitated. Substitution is prohibited. The period of service is 15 years; 6 in active service, and 9 in the reserve. The Russian military forces are composed of regular and irregular troops. The regular troops comprise 164 regiments of infantry, 281,012 men; cavalry, 52 regiments, 42,444 men; artillery, 33,021 men; engineers, 9819 men; train, 4617 men. Total of field troops in time of peace, 370,913. In war as follows: infantry, 568,253 men; cavalry, 47,379; artillery, 40,846; engineers, 13,306; train, 21,329—total, 691,113. With local and other troops (in fortresses, etc.), and reserve troops, the Russian army in Europe amounts, on the peace footing, to 19,103 officers, and 508,674 men; in war, 22,871 officers, and 879,755 men. The army of the Caucasus amounts in peace to 125,643; in war, to 167,841. The army of Turkestan to 22,906; of Siberia, from 25,000 to 27,000. Besides some thousand troops as gendarmes and in various military establishments, there is a grand total for the regular Russian army of 33,000 officers and 733,000 men; on the war-footing, 39,380 officers and 1,213,259

men. In addition there are the irregular troops, comprising about 190,000 men, chiefly cavalry.

*Denmark.*—All able-bodied young men 21 years of age are liable to serve 8 years in the regular army of Denmark, and 8 years in the reserve. Denmark has 31 battalions of infantry (guards, line, reserve), comprising 26,750 men; 5 regiments of cavalry, with 2122 men; 2 regiments and 2 battalions of artillery, with 6523 men; 2 battalions of engineers with 580 men. The total, line and reserve, is 1031 officers, 35,975 men; on the war-footing, 52,656 men.

*Sweden and Norway.*—There are five classes of soldiers in Sweden; the enlisted troops, the national militia (indelta), the conscription troops (bevaering or landvaern), the militia of Gothland, and the volunteers. Of the soldiers of the line there is a total of 35,646 men; of the reserve (landvaern), 86,101; of the Gothland militia and volunteers, 150,830. Norway has an army of its own, divided into the troops of the line, with reserve, military train, the landvaern, the civic guards, and the landstorm. The troops of the line are 12,000 in time of peace; in time of war not more than 18,000 without the assent of the storting.

*Holland.*—The army of the Netherlands is formed partly by conscription and partly by enlistment; and there is besides a militia. The European army has, of infantry, 1122 officers and 43,690 men; cavalry, 184 officers and 4318 men; engineers, 1035 men; artillery, 421 officers and 10,610 men. With the staff, etc., the total force is 62,068 officers and men. There is besides in the East Indies a force of 27,659 officers and men.

*Belgium.*—The standing army is formed by conscription. Substitution is permitted. The legal period of service is 8 years. Belgium has 74,000 infantry (16 regiments), 8848 cavalry (7 regiments and 2 squadrons), 14,513 artillery (6 regiments), 2486 engineers. In all, and without officers, 99,847.

*Italy.*—The Sardinian law of conscription forms the basis of the Italian military system. The infantry of the line under arms on the peace-footing number 86,017; the bersaglieri, 16,818; depots, 11,560; the cavalry, 18,449; the artillery, 19,732; engineers, 3027; carbiniers, 20,915; administrative troops, etc., 7047; giving a total of 183,205. On the war-footing, these several forces are so increased as to give a total of 541,575; and with the addition of the provincial militia, 743,656.

*Spain.*—The army of Spain was reorganized in 1868 after the model of that of France. The active army has 60,000 infantry, 9000 cavalry, 2500 engineers, and 8500 artillery, making a total of 80,000 men. The reserves increase this number to 216,000. There is besides an army of 54,500 in Cuba, 9400 in Porto Rico, and of 9000 in the Philippines.

*Switzerland.*—The federal army has 1269 engineers, 8401 artillery, 1942 cavalry, 6078 tirailleurs, 65,991 infantry, and 364 of a sanitary corps. In all, 84,045. There are, besides, of the reserves, 51,102; the landwehr, 65,562; giving a total available military force of 201,578.

*Turkey.*—In 1871, the Turkish regular army had infantry to the number of 72,000; cavalry, 9000; artillery, 9500; engineers, 1600; with 1200 miscellaneous troops amounting to 93,300. Before the war of 1877 it was proposed that by 1878 the regular army should be increased to 152,000. The irregulars (Bashi-bazouks, Spahis, etc.) are about 70,000. And the contingents which the dependent states are bound to furnish are severally: Upper Albania, 10,000; Bosnia, 30,000; Egypt, 15,000; Tunis and Tripoli, 4000.

*United States.*—At the commencement of 1861 the U.S. army consisted only of about 14,000 regular troops. In various successive levies by the president during the civil war (1861-1865), as many as 2,653,062 men had been called out—nearly one fourth of the entire population of the northern states. After the war the standing army was steadily diminished; and by a law passed in 1870 it is provided that there shall be no more than 30,000 enlisted men at one time. That force is distributed amongst 25 regiments of infantry, 10 of cavalry, 5 of artillery, and 1 battalion of engineers. Besides the regular army there is the militia, of which the nominal strength was at the last census, 3,245,000.

A separate and fuller treatment of the army of Great Britain is reserved for BRITISH ARMY; and for that in our Indian possessions see EAST INDIA ARMY. All the various matters relating to the formation, organization, discipline, arms, equipments, duties, and tactics of A., will be found succinctly treated under appropriate headings.

**ARMILLARY SPHERE** (*armilla*, a ring), an instrument intended to give a just conception of the constitution of the heavens, and of the motions of the heavenly bodies, as seen by an observer on the earth. It consists of a number of rings fixed together so as to represent the principal circles of the celestial sphere, and these are movable round the polar axis within a meridian and horizon, as in the ordinary celestial globe. It was by means of such rings furnished with sights that Hipparchus, Ptolemy, and other ancient astronomers made many of their observations, and we find even Tycho Brahe making most of his planetary observations with the help of such an instrument. The A. S. is, however, now only used as an aid to instruction in astronomy, and in this respect is generally supplanted by the celestial globe. The object aimed at in the A. S. will be better understood by reference to the celestial globe represented in the diagram. Supposing the observer on the earth to be in the center of the sphere, the earth on which he stands shuts out from his view the lower half of the heavens, or the part lying below the horizon HH. The hemisphere above him may be regarded as divided into two equal

portions, an eastern and a western, by the meridian MM, which passes through the pole

P, and the zenith Z, of which the eastern half is shown in the figure. The north pole is supposed to be elevated above the horizon, and its elevation is measured by the arc NP, or the height above the n. point; and the heavens appear to rotate round an axis PQ, of which P is one extremity; the south pole, Q, the other extremity, being below the horizon. The meridian MM, and the horizon HH, are the only circles which maintain a fixed position with regard to the observer. Of the other leading celestial circles, the equator or equinoctial LL, extending from the e. to the w. point of the horizon, the tropics of Cancer and Capricorn, respectively BB and CC, and the arctic circle AA, although rotating with the stars, maintain the same position with regard to the horizon; while the ecliptic, KK, is constantly changing its inclination and position towards it. Circles which extend from pole to pole, cutting the equator at right angles, are called circles of declination. The circle which passes through the vernal equinox  $\varphi$  (see *ARIES*), is denominated the equi-

noctial colure; and that passing through the summer solstice O (see *SOLSTICE*), the solstitial colure. The circles just named, together with the antarctic circle, are represented by corresponding rings in the A. S. If S be a star, the following are the names given to the arcs which determine its position with regard to these circles:  $\varphi$  V, right ascension; SV, declination; SP, polar distance; SZ, zenith distance; XS, altitude;  $(XN + 180^\circ)$ , azimuth reckoned from the south pole westward.

**ARMINIUS, JACOBUS**, the founder of Arminianism, was b. at Oudewater (Old Water) in 1560. His real name in Dutch was James Harmensen; but in accordance with the prevailing custom amongst scholars in those days, he Latinized it. His father was a cutler, and died when A. was a child. After a preliminary education at Utrecht, he commenced (in 1575) a course of study at the newly-founded university of Leyden, where he remained for six years, and where he seems to have acquired a high reputation, for the Amsterdam merchants undertook to bear the expense of his further studies for the ministry, on condition that he would not preach out of their city unless permitted to do so. In 1582, he went to Geneva, and received the instructions of Theodore Beza, the most rigid of Calvinists. Here he made himself odious by the boldness with which he defended the logic of Peter Ramus, in opposition to that of the Aristotelians of Geneva, and in consequence had to retire to Basle, whither his fame must have preceded him, for he was offered by the faculty of divinity in that university the degree of doctor gratis, which, however, he did not venture to accept, on account of his youth. At Basle he studied under Gyrnæus. He subsequently (1586) traveled into Italy. On his return to Amsterdam (1588), he was appointed minister. Shortly after this, he was commissioned to defend the doctrine of Beza, regarding predestination, against the changes which the ministers of Delft had proposed to make on it. A. carefully examined both sides of the question, but the result of his study was, that he himself began to doubt, and at last came to adopt the opinions he had been commissioned to confute. Some time after this change of view, he came, in the course of his expositions, upon the epistle to the Romans, the most explicitly doctrinal in the New Testament, and the 8th and 9th chapters of which have always been considered the strongholds of Calvinism. His treatment of this epistle excited much dissatisfaction, and involved him in sharp disputes with his orthodox brethren. Still his views were, as yet, either ambiguously or vaguely expressed, or, at least, had not attained to that clear consistency they subsequently acquired, for in 1604 he was made professor of theology in the university of Leyden.

The greatest enemy of A. was Francis Gomar, his colleague in the university of Leyden. In the course of the year 1604, the latter attacked his doctrines, and from that hour to the end of his life, A. was engaged in a series of bitter disputes with his opponents. The *odium theologicum* was never exhibited in more unmingled purity. Arminius asserted, in substance, that God bestows forgiveness and eternal life on all who repent of their sins and believe in Christ; he wills that all men should attain salvation, and only because he has from eternity foreseen the belief or unbelief of individuals, has he from eternity determined the fate of each. On the other hand, Gomar and his party, appealing to the Belgic confession and the Heidelberg catechism, maintained, that God

had, by an eternal decree, predestinated what persons shall, as being elected to salvation, be therefore awakened to repentance and faith and by grace made to persevere therein; and what persons shall, as being rejected (*reprobati*), be left to sin, to unbelief, and to perdition. See PREDESTINATION, PERSEVERANCE OF SAINTS.

While these fierce disputes were continuing, A., who was not destitute either of friends or influence, was created *rector magnificus* of the university, but resigned the honor on the 8th of Feb., 1606, having held the office only for one year. All the pulpits in Holland now fulminated against him. At length, in 1608, A. himself applied to the states of Holland to convoke a synod for the purpose of settling the controversy; but, worn out with care and disease, he died, on the 19th of Oct., 1609, before it was held, leaving seven sons and two daughters by his wife, Elizabeth Reael, daughter of Laurent Reael, a judge and senator of Amsterdam.

There can be no doubt that A. himself was much less Arminian than his followers. He had not matured his opinions sufficiently to elaborate a complete system of anti-Calvinistic doctrine, though it is perfectly certain that the conclusions at which his disciples arrived—as stated in the famous “Five Articles”—are the logical and legitimate results of his teaching. He always complained, however, that his opinions were misrepresented; but this is invariably the fate of controversialists, and the penalty of controversy. A. was an extremely good man, as even his enemies allow; his abilities were also of a high order; his thinking is clear, bold, and vigorous; his style remarkably methodical, and his scholarship respectable, if not profound.

After the death of A., his followers gained strength, and boldly asserted their views, but still remained in a minority. In 1610, they presented to the assembled states of the province of Holland a “remonstrance”—from which they were styled “Remonstrants”—which contained the following propositions: 1. That God had indeed made an eternal decree, but only on the conditional terms that all who believe in Christ shall be saved, while all who refuse to believe must perish; so that predestination is only conditional. 2. That Christ died for all men, but that none except believers are really saved by his death. The intention, in other words, is universal, but the efficacy may be restricted by unbelief. 3. That no man is of himself able to exercise a saving faith, but must be born again of God in Christ through the Holy Spirit. 4. That without the grace of God, man can neither think, will, nor do anything good; yet that grace does not act in men in an irresistible way. 5. That believers are able, by the aid of the Holy Spirit, victoriously to resist sin; but that the question of the possibility of a fall from grace must be determined by a further examination of the Scriptures on this point.

This last point, left as an open question, was decided by the Remonstrants in the affirmative soon afterwards (1611). Whereupon the Gomarists (Calvinists) put forth a strong “counter-remonstrance,” asserting plainly absolute predestination and reprobation. After several fruitless discussions, the states of Holland, in Jan., 1614, acting under the advice of Oldenbarneveld, a senator, and the learned Hugo Grotius, issued an edict of full toleration for both parties, prohibiting at the same time the continuance of the controversy. The counter-remonstrants (or Calvinists) refused to submit to this edict, and the strife soon became so furious, that in 1617, or soon afterwards, the Arminians found it necessary to guard themselves from personal violence by appointing a safeguard of militia-men (*Waardegelders*). The controversy now merged in the strife of party politics. The ambitious Maurice of Orange took advantage of the passions of the majority to crush his opponents of the republican party, whose leaders were adherents of the Arminian doctrines. Several Arminians were put to death—among them the aged senator Oldenbarneveld, May 13, 1619—while Grotius and others were imprisoned. In these circumstances, the synod of Dort was held (1618-1619), attended by selected representatives from the Netherlands, England, Scotland, the Palatinate, Switzerland, Nassau, East Friesland, and Bremen. From this convocation (Jan. 14, 1619), the 13 Arminian pastors, with the learned and eloquent Simon Episcopius at their head, were excluded. The doctrines of the counter-remonstrants were embodied in 93 canons; the Belgic confession and the Heidelberg catechism were confirmed as authorities for the reformed churches of the Netherlands; and 800 Arminians (chiefly preachers) were expelled from office. In consequence of this decision, the defeated party sought shelter in France, Holstein, England, etc. Afterwards, under Frederick-Henry, the stadtholder after prince Maurice (1630), they were again tolerated in Holland, and in 1634 Episcopius opened his theological college in Amsterdam.

Since that time, the remonstrants (or Arminians) in Holland have inclined more and more towards freedom of thought on religious questions, and independence in church government. The rejection of all creeds and confessions; the free interpretation of the scriptures; a preference of moral to doctrinal teaching; Arian views respecting the Trinity; the virtual rejection of the doctrines of original sin and imputed righteousness, and the view of the sacraments as merely edifying forms or ceremonies; all these and other points of belief display the same tendency which is found in their church polity. Their annual conference on ecclesiastical affairs is composed of ministers and lay-deputies, and takes place in June, alternately at Amsterdam and Rotterdam. The number of remonstrants is now only about 5000, and is still decreasing. In 1809, they had 34 congregations with 40 preachers in Holland; but in 1870, only about 20 congregations. The largest society of Arminians is in Rotterdam, and numbers only 600 members.

Although the Arminians are thus dwindling away as a distinct body, their tenets respecting predestination have been adopted with greater or less modification by several other Christian denominations (see METHODISTS, BAPTISTS); as well as by multitudes of the individual members of those churches whose formularies are Calvinistic (see CALVINISM). They are also very prevalent in the church of Rome.

ARMINIUS. See HERMANN, or HERMAN, *ante*.

**ARMISTICE**, a suspension of hostilities between two armies, or two nations at war, by mutual agreement. It sometimes takes place when both are exhausted, and at other times when an endeavor to form a treaty of peace is being made. A particular example will best illustrate the nature of an A. On the 25th of Feb., 1856, the representatives of England, France, Austria, Prussia, Sardinia, Turkey, and Russia, met in congress at Paris, to consider the terms of a treaty of peace which should terminate the war at that time going on between five of the above-named powers. The British nation was very unwilling to suspend hostilities during the sitting of the congress—partly on account of the numerous failures of diplomacy in the preceding year, and partly because Russia was suspected of only wishing to gain time. It was agreed, however, at the first sitting, in conformity with the laws of nations and the usages of war, that an A. should be declared, to be announced by telegraphic message to the commanders in the Crimea, and to last until the 31st of March. During that period of about one calendar month, the hostile armies were to remain strictly at peace, but the fleets of the allies were to continue their blockade of Russian ports. The information reached the generals late on the 28th of Feb. On the morning of the 29th, a white flag was hoisted in the Russian camp outside Sebastopol; several Russian officers assembled around it; and a glittering cavalcade of British, French, and Sardinian officers proceeded thither. The accredited officers compared notes, found the terms of the A. clear, agreed on a boundary-line between the hitherto hostile forces, and formally gave pledges for a cessation of fighting. The courtesy of civilized nations at once succeeded to the horrors of war; the Russian commander gave a magnificent entertainment to the allied commanders, and was entertained in turn; the soldiers "fraternized" by little gifts of tobacco, and ludicrous attempts at conversation, across a small stream which formed part of the boundary-line; and a few British officers were permitted to make excursions into the interior of the Crimea. The A. ended on Mar. 31, not by a renewal of hostilities, but by the signing of a treaty of peace.

ARMITAGE, EDWARD, an English historical painter, b. May 20, 1817. He was educated in Germany and France, and was a pupil of Delaroche in 1837. In 1843, he gained the first prize for cartoons, and in 1847 a prize for oil painting. His more noteworthy frescos are in St. John's (Roman Catholic) church in London, and in the new houses of parliament.

ARMITAGE, THOMAS, D.D., b. England, 1819; came to America in 1838, and entered the ministry of the M. E. church. Ten years later he became a Baptist, and he is now settled over a church of that denomination in New York. He was active in the organization of the American Bible union, and a strong advocate of the revision of the Bible with a view to bringing out what he thought the correct interpretation of the words which relate to baptism. He ministers to a strong and active congregation.

**ARMOR** is a general name for the apparatus for personal defense, as contradistinguished from arms or weapons of offense. Little of it is worn by soldiers at the present day, seeing that hand-to-hand conflicts, in which it is especially serviceable, are rather exceptional in modern warfare. It was before the invention of gunpowder that A.—often called in England by the name of *harness*—was especially used.

All the ancient nations who occupy a place in history were accustomed to adopt one or other of the defensive clothing or implements which collectively come under the denomination of A. Leather A. was sometimes worn; but brass, iron, and other metals were preferred. Some of the more luxurious leaders had much silver and gold in their A. In the Bible, shields, helmets, breastplates, and greaves, are mentioned among the articles of A. borne or worn by the Israelites and their opponents. The classical writers Homer, Xenophon, Herodotus, Livy, Tacitus, Varro, etc.—supply abundant evidence of the use of A. among the nations concerning whom they wrote.

It is believed that the early Britons bore little or no other A. than shields. The Anglo-Saxons were more fully provided. At different times before the Norman conquest they appear to have had four-cornered helmets; loriceæ made of leather; scale-A.; leathern helmets; wooden shields covered with leather; sheep-skin shields; conical caps or helmets of metal; pectorals or neck-guards; breast-guards of undressed hide; flat-ringed A.; byrnes or tunics of overlapping pieces of leather, close-fitting cuirasses of leather, and sometimes of strong linen; leg-guards of twisted woollen cloth; shields of various sizes, from half a yard to a yard and a half in length; and casques having more or less resemblance to the ancient helmets. When the Danes were in Britain, they had at first no other A. than leathern neck-pieces, which descended some way over the shoulders and chest; and greaves or shin-pieces for the legs. In the time of Canute or Knute, however, they adopted a kind of A. which Sir Samuel Meyrick supposes them to have borrowed from the Norsemen or Norwegians. It comprised a tunic, with a hood and long

sleeves; pantaloons which covered feet as well as legs; and sugar-loaf-shaped helmets or skullcaps, with attached pieces which hid nearly the whole face except the eyes. All these were probably made of leather; but most of the surfaces were strengthened by scales or scales, a perforated network of steel.

With William the conqueror came in the kinds of A. which were at that time prevalent among the knights and soldiers of the continent of Europe, and which became afterwards more or less combined with the A. previously known in England. William himself occasionally wore a hauberk of ring-A. This kind of A. was much worn during his reign, the rings being usually attached to a foundation of leather. One curious variety of ring-A., called the haubergeon, had the tunic and breeches all in one piece. The helmets were generally conical, with a nasal or nose guard descending from the front. A distinct ring-A., called *hose*, was often worn on the legs. The shield was generally kite-shaped, unlike the oval shields carried by the Anglo-Saxons. Gradual changes in these various portions of A. were made between the reigns of William Rufus and John. Under Henry III., we find stitched and padded hauberks and chausses, called "ouvrages de pourpointerie;" suits of ring-A.; greaves or shin-pieces of steel; poleyns or knee-guards; vambraces or arm-guards; jacks, jaques, or jackets, made of leather, and worn over the ring-A.; interlaced ring-A., of oriental invention, not requiring to be stitched to any garment or foundation; helmets, visors, and skullcaps of various forms; and chanfrons, or A. for the head and face of horses. During Edward III.'s reign, iron plate-A. was much used by troopers, in the various forms of helmet, breastplate, gauntlet, and greaves. In the 14th c., chain-mail fell into disuse, and was succeeded by plate-A.; this last-named kind became more and more complicated, and reached its greatest pitch of elaboration in the reign of Richard III. During the times of Henry VII. and VIII., the A. was sometimes fluted, often elaborately engraved, and even damascened or inlaid with gold. Under James I., the knightly ideas of the feudal times gave way, and the use of A. declined; a knight armed *cap-à-pie* was a rarity. Charles I. tried to revive its use, but he had few followers; and the days of Cromwell may be regarded as the last in which A. was worn to any considerable extent by the regular soldiers. Helmets and cuirasses are still worn by the three regiments of household cavalry (life-guards and horse-guards), but more for show than for service.

The chief pieces of A. will be found briefly described and illustrated under the proper headings.

**ARMORER.** The old meaning of this word has nearly passed away with the system to which it belonged. The armor-smiths, or makers of armor, were among the most skillful workers in metal during the feudal times; but their trade afterwards fell away. In the year 1690, the workmen-armorers of London, in a petition to parliament, complained that their trade was well-nigh ruined.

Armorers, in a somewhat different sense of the word, belong to the British army and navy at the present time. There are armorers to every regiment, not to make armor, but to repair arms. There is one to each regiment of cavalry, and one to each battalion of infantry and brigade of artillery. The A. is paid 4s. 11d. a day, besides a small allowance for certain work performed. There is a school for training "A. sergeants" at the Small Arms Factory, Enfield, where the men work, after enlistment, until drafted to a regiment; and whither they return from time to time to refresh their mechanical memories.

On shipboard, the A. is a first-class petty officer, who has, under the gunner, charge of all the muskets, pistols, cutlasses, boarding-pikes, etc., which he is expected to keep clean and in ready order. He is assisted by certain seamen called the "A.'s crew;" and all are skilled in the general routine of smith's work.

**ARMORICA**, the country of the Armorici, i.e., "the dwellers on the sea" (Celt. *ar*, on or near, and *mor*, sea), the name by which the people occupying the coast of Gaul between the Seine and the Loire were known to Caesar. At a later period, the name A. was confined to the country afterwards styled Britannia Minor, or Bretagne (q.v.).

**ARMOR PLATES.** The employment of thick slabs of iron to protect the sides of ships of war and the fronts of fortifications, is quite a recent invention; or rather, the modern system is the practical realization of plans suggested long ago by Mersenne and others. In 1842, Mr. Balmano of New York proposed that war-ships should be clad with several thicknesses of iron plate, riveted one upon another, the plates being individually  $\frac{1}{4}$ th inch thick. Soon afterwards, Mr. Stevens, an American ship-builder, made further suggestions on the same subject, and other practical men kept the matter before the attention of the authorities in various countries. In 1854, the French sent several floating-batteries to the Black sea, clad with iron plates; and the English admiralty hastily imitated this example, producing eight very slow and unmanageable batteries in 1855-56. Then came in a flood of suggestions for arming our regular ships of war in a similar way. The admiralty, dismayed at the thought of dismantling the existing fleet, which had cost so much, delayed the subject as long as they could, but without abandoning it. In 1860, the French sent to sea *La Gloire*, a timber-built ship of war, altered from a 90-gun three-decker to a 40-gun corvette, clad with  $\frac{1}{4}$ -inch iron plates, having a burden of 3000 tons. This proceeding at once set the English government on the alert; they saw that further delay would be imprudent, and they set

about the creation of an armor-clad navy. Many problems had to be solved—whether to case old wooden ships with armor; to build and case new wooden ships; or to build new vessels, of which the hull as well as the armor should be of iron. Then arose further problems—how near the bulwarks should the armor-plates come, how near the bottom of the vessel, how near the stem and stern; also, what thickness of iron, and whether the same thickness in every part.

From 1861 to 1876, the British Admiralty were engaged on a series of costly constructions and reconstructions, intended to afford eventually solutions to the above problems. Several of the ships built have cost from £300,000 to £450,000 each; several half-finished timber three-deckers have been cut down and converted into iron-clads; and variations of detail almost innumerable have been introduced. The following is a list of English vessels which in 1876 formed the iron-clad navy. Those which are wholly clad—i.e., covered with armor-plates in all parts of the hull needing protection—are the *Minotaur*, *Agincourt*, *Northumberland*, *Royal Oak*, *Prince Consort*, *Caledonia*, *Ocean*, *Lord Clyde*, *Lord Warden*, *Audacious*, *Invincible*, *Prince Albert*, *Scorpion*, *Wyvern*, *Monarch*, *Iron Duke*, *Sultan*, *Glatton*, *Cyclops*, *Hecate*, *Hydra*, *Gorgon*, *Dreadnought*, *Devastation*, *Thunderer*, *Swiftsure*, *Triumph*, *Rupert*, *Hotspur*, *Hercules*, *Inflexible*, *Alexander*, and *Shannon*. Those which are partially clad—i.e., covered with armor-plates only in the more exposed portions—comprise the *Black Prince*, *Warrior*, *Defense*, *Resistance*, *Achilles*, *Hector*, *Valiant*, *Royal Alfred*, *Bellerophon*, *Zealous*, *Pallas*, *Favorite*, *Research*, *Enterprise*, *Viper*, *Vixen*, *Waterwitch*, *Penelope*. Regarded as to the material of which the hulls are mostly built, and on which the armor-plates are laid, the following are timber-built: *Royal Oak*, *Prince Consort*, *Caledonia*, *Ocean*, *Royal Alfred*, *Zealous*, *Lord Clyde*, *Lord Warden*, *Pallas*, *Favorite*, *Research*, and *Enterprise*. The *Vixen* is wood and iron; the *Swiftsure* and *Triumph* are iron sheathed with wood; all the rest are iron. The dimensions and weight of these ships, laden with armor-plates from 3 to 24 in. thick, are enormous. The load displacement of five of them exceeds 10,000 tons each; six, 9000 to 10,000; four, 7000 to 9000; twelve, 6000 to 7000; seven, 4000 to 6000. Some of the steam-engines for these ponderous ships, nominally of 1200 horse-power, work up to (indicated) 8000 h.p. Whatever the thickness of the armor, the plates are nicely tongued and grooved to fit closely together edgewise. The bolts which fasten them to the ship are generally 2 to 2½ in. thick, expanded at one end to form a head, and having a screw-thread at the other to receive a nut.

It is not yet known whether the thickest armor will resist any shot that can be hurled against it; whether, in other words, the thickest practicable armor will overcome, or be overcome by, the heaviest practicable shot. Experiments at enormous cost have been conducted by the government for some years to determine this important question: a natural result has been that cannon are made larger and larger, and armor-plates thicker and thicker, in the struggle between artillery and ship-building. The experiments (so far as England is concerned) have been conducted principally at Shoeburyness, but also on board the *Thunderer* at Portsmouth. The usual mode is, to construct a target resembling the armed side of one of our iron-clads, and then to try to pierce it with shot fired from guns at various distances. A *Warrior* target, for instance, consists of a 4½-in. armor-plate, backed by 18 in. of teak, and an inner skin of ¾-in. iron; while a *Lord Warden* target has 4½ in. plate, 30 in. teak, and 1½ in. skin. A few examples will serve to illustrate the method of proceeding.

In Aug., 1866, a *Warrior* target was built up at Shoeburyness—i.e., a target similar in strength and construction to the side of that ship. Alderson's steel shell, Armstrong's conical shell, and Palliser's chilled-iron shell were fired at it from a 7-in. gun at 200 yards: the Palliser shot excelled the others, going clean through the target, armor and all, and bursting behind. On another occasion, a Palliser 115-lb. shot went through the target even at an angle of 30° from the perpendicular. The *Lord Warden* target has been pierced by 9½ and 10-in. shot at a distance of 1000 yards; while the thinner *Warrior* target was pierced at 2000 yards. The *Bellerophon* and *Hercules* targets were more ponderous.

At the end of 1878, the British navy consisted of 64 ships afloat or building, of which 46 were efficient. They were divided into five classes, the first two of which contain only the formidable turret-ships. The armor of the first class, comprising 4 ships, ranged from 12 to 24 in. in thickness: the *Infexible* has armor from 16 to 24 in. The second class, of 9 ships, has armor from 8 to 14 in. thick. The third, of 16 ships, from 5 to 12 in. The fourth, of 4 ships, from 6 to 10 in. In the fifth class, 13 ships, the armor is from 4½ to 5½ in. The last class comprises the old iron-clads, the *Warrior*, *Black Prince*, and others.

Armor-clad forts are also attracting attention. Iron has been used largely in the defenses of Plymouth and Portsmouth. In 1864, a line of iron-clad fort was built up at Shoeburyness, to test several modes of construction. In the same year, the Russian government employed the Millwall company to build a wrought-iron shield, as an experiment for the defenses of Cronstadt. The front was made of 12 in. thick of iron in horizontal bars; this was backed by 14 in. of thickness in upright bars; and the whole strengthened with enormous struts, brackets, ribs, and dovetails of iron. The shield was to form the facing or armor for a battery of three of Krupp's 600-pounder steel guns, and measured 43 ft. by 10. The shield, with its foundation-plate, weighed 140 tons. In

one experiment at Shobury, a plate 13 in. thick was placed in front of a mass of granite 14 ft. thick, and fired at with 200-pounders: four shots cracked the granite, although the plate was not pierced. The Americans made an experiment in Chesapeake Bay, in Sept., 1866, on a temporary fortification, made of enormous granite blocks faced with 10-in. armor; shots of 430 and 620 lbs. were fired from Rodman guns, at a range of 350 yards, and eleven such shots destroyed the whole fabric. The *Thunderer* has been fitted up as a target-ship at Portsmouth, partly to test very thick plates at very short distances. The plates are fastened to an enormous bulkhead near one end of the ship, and the guns placed near the other end. On one special occasion, a Palliser 115-lb. chilled shot, with an extra charge of powder fired at 25 ft. off, went clean through a 7-in. plate and 45 in. of teak bulkhead. On another occasion, soon afterwards, a *Hercules* target, with a 9-in. plate, was fired at with an 8-in. spherical shot at 30 ft.; the shot made a dent 2½ in. deep, but did not further disturb the plate. The 24-in. armor of the *Invincible* is divided into two 12-in. plates, with 9 in. of teak between—the theory of this arrangement being that the outer plate, even if pierced, will shatter the shot, which will then be stopped by the inner armor. Dr. Collis Brown has suggested a system of sloping armored sides which would give a ship armor of 36 in. at any given point in a displacement not exceeding that of existing iron-clads. In the trial of the 100-ton Armstrong gun at Spezzia, a steel armor-plate was fired at, and the shot, though it penetrated the plate, was stopped in the backing.

Regarded as articles of manufacture, armor-plates were at first produced mainly by hammering, several thicknesses of iron being welded one upon another, at a white heat, by blows of a ponderous steam-hammer; but it is now more customary to produce them by rolling than by hammering—pressure being considered to produce more satisfactory results than percussion. Whatever the thickness of the slab is to be, operations are commenced with plates about an inch thick: these are heated, rolled, cut, piled up, heated and rolled over and over again, until the required thickness is produced. The rollers are placed further and further apart, as the slab becomes thicker and thicker. Some of them are truly enormous masses of metal, solid cylinders 8 ft. long by 32 in. diameter. At the Atlas works of Messrs. Brown & Co., Sheffield (the chief manufactory for armor-plates), there has been produced a rolled slab 17 ft. long, 7 ft. wide, and 14 in. thick, weighing 30 tons. At Grüsser, in Germany, some excellent armor-plates of chilled (cast) iron have been manufactured. For armor-plates, the metal is very scrupulously selected, and every part of the processes conducted with great caution.

**ARMORY** may mean a storehouse for arms; but the name is also often applied to a collection of ancient armor and weapons—such as those in the tower of London, in Sir Samuel Meyrick's mansion at Goodrich court on the Wye, and in Warwick castle.

**ARMS**, or weapons of offense, may be divided into two great classes—those that act by means of gunpowder, and those that do not. Of arms that act otherwise than by explosion, the greater part have been in use from the earliest times; they include the bow and arrow, sling, pike, spear, lance, dart, javelin, dagger, axe, mace, spiked or knotted club, scythe for chariots, dirk, bayonet, sword, cutlass, etc., together with such artillery as the ballista, catapult, and battering-ram. Weapons depending on the use of gunpowder are of two kinds—those that can be held in the hand, and those that are too heavy to be portable. In the first class, we find the names of the hand-cannon, hand-gun, arquebus, haquebuts, demi-haque, matchlock, wheel-lock, firelock, currier, snap-haunce, caliver, eslopette, petronel, dragon, hand-mortar, dag, tricker-lock, carbine, fusil, fowlingpiece, blunderbuss, pistol, musket or musquet, musketoon, rifle, etc. In the second class, more usually included under the name of artillery, we find the springel, war-wolf, bombard, cart-of-war, culverin, demi-culverin, serpentine, falcon, saker, cannon, howitzer, petard, carronade, mortar, rifled cannon, war-rockets, etc. The more important of these are briefly noticed under the proper headings. It is needless, perhaps, to add that nine tenths of these are utterly obsolete.

The surveyor-gen. of the ordnance in the British army has the duty of providing and keeping efficient the arms in use by the regular and auxiliary forces, and of maintaining an ample reserve in the royal arsenals. Each regiment makes a report on these subjects yearly. If the commanding officer of a regiment ascertains that a new supply of arms is needed for the men under him, or a supply of anything in relation to the arms, he indents upon the controller of the district for the supply required; which is forthwith made by that officer, subject, however, to a pecuniary fine upon the regiment, if the arms have not lasted a fair time.

**ARMS, ARMORIAL BEARINGS, or ENSIGNS**, are the names given to such devices as when painted on a shield form a coat. These terms in popular speech include all the accompaniments of a shield—viz., the crest, helmet, and, where such exist, the supporters, etc. See these terms, and **HERALDRY**.

**ARMS, ASSUMPTIVE.** See **HERALDRY**.

**ARMS, BELLS OF**, are tents, mostly of a conical shape, for containing the small-arms for each company in a regiment of infantry. The tent is frequently painted with the color of the facings of the regimental uniforms.

**ARMS, MESSENGERS AT.** See **MESSENGERS-AT-ARMS**.

**ARMS, SERGEANT AT.** See **SERGEANT-AT-ARMS.**

**ARMS, STAND OF.** A stand of A. is the complete set necessary for the equipment of one soldier, whether horse or foot.

**ARMSTRONG**, a co. in w. Pennsylvania, on both sides of Alleghany river; 750 sq.m.; pop. '70, 43,882. It has a rough and hilly surface, but good lands in the river valleys. The products are salt, iron, coal, and limestone. Two railroads border or intersect it. Co. seat, Kittanning.

**ARMSTRONG, JOHN**, physician and poet, was b. about 1709 at Castletown, a pastoral parish in Roxburghshire, of which his father was minister. He studied medicine at the university of Edinburgh, where he took the degree of M.D., Feb. 4, 1732. Soon after, he commenced practice in London, and became known by the publication of several fugitive pieces and medical essays. In 1737, he published a very objectionable poem, *The Economy of Love*, which injured his reputation for a time. His principal work, *The Art of Preserving Health*, a didactic poem in blank verse, extending through four books, appeared in 1744. In 1746, he was appointed physician to the hospital for sick and lame soldiers. In 1751, he published a volume on *Benecolence*; in 1753, a poetical epistle on *Taste*; and in 1758, a volume of prose essays of no great merit. In 1760, he was appointed physician to the forces in Germany. In 1761 appeared from his pen *Day, a Poem*. On the peace in 1763, he returned to London, and resumed practice. In 1771, he made a continental tour with Fuseli, the painter, an account of which he published, with the title of *A Short Ramble through some Parts of France and Italy, by Lancelot Temple, Esq.* His last work was a volume of medical essays. He contributed to Thomson's *Castle of Indolence* the four stanzas at the end of the first part, descriptive of the diseases resulting from sloth. D. 7th Sept., 1779. A. was the friend of Thomson, Mallet, Aaron Hill, Dr. Young, Wilkes, and the principal wits and literary men of the period. He seems to have been a reserved, indolent, and splenetic man, "who quite detested talk;" kind-hearted withal, and of frugal habits, having left £3000, saved out of a small and precarious income. His fame rests entirely on *The Art of Preserving Health*, his other works being now only known by name.

**ARMSTRONG, JOHN**, an eminent physician and medical writer, was b. 8th May, 1784, at Ayres Quay, near Bishop-Wearmouth, where his father was the superintendent of some glassworks. He studied medicine at the university of Edinburgh, and in June, 1808, took the degree of M.D. He commenced practice at Bishop-Wearmouth, and in 1811 was chosen physician to the infirmary at Sunderland. In 1816, he published a work on *Typhus*, which greatly extended his reputation. His researches concerning the causes and phenomena of febrile diseases having made his name well known in the metropolis, he was induced, in Feb., 1818, to remove to London, where his practice became extensive, and he was elected physician to the fever hospital. In 1831, in concert with Mr. Edward Grainger, he established a medical school in Webb street, Brough, where he lectured on the practice of physic. He also delivered a course of lectures on materia medica. In 1826, he joined Dr. Boot and Mr. E. Bennett in establishing a new school of medicine in Dean street, Soho, but shortly after relinquished his connection with it. He d. of consumption, 12th Dec., 1829, aged 45. Exclusively devoted to the duties of his profession, Dr. A. was very successful in the elucidation of medical science. His works are numerous, and he contributed various papers to the medical journals. His lectures, inserted in the *Lancet* in 1825, were published in a separate form after his death, with the following title: *Lectures on the Morbid Anatomy, Nature, and Treatment of Acute and Chronic Diseases, by the late John Armstrong, M.D. Edited by Joseph Riv-* one of his pupils. (London, 1834, 8vo.)

**ARMSTRONG, JOHN**, d. 1795; b. Penn.; leader of the successful expedition in 1756 against the Indian allies of the French at Kittanning, Penn. In the revolutionary army he was a brig.-gen. at fort Moultrie, and commanded the militia at Brandywine and Germantown. He served twice in the continental congress, 1778-80 and 1787-88.

**ARMSTRONG, JOHN**, 1758-1843; an American soldier and writer. While a student he volunteered, was soon made aid-de-camp to gen. Mercer, and was with Gates in the Burgoyne campaign, leaving the service with the rank of major. He wrote the *Newburgh Letters*, setting forth the hardships of the revolutionary soldiers in respect to pay. He was attorney gen. of Pennsylvania; United States senator from New York, 1800-4; minister to France, 1804-10; brigadier-gen. in the war of 1812; and secretary of war, 1813-14. He was charged with inefficiency in consequence of the capture of Washington, and resigned, Sept., 1814. He published a *History of the War of 1812*, *Memoirs of Montgomery and Wayne*, a *Review of Gen. Wilkinson's Memoirs*, and partially prepared a history of the revolution.

**ARMSTRONG, RICHARD**, D.D., 1805-60; b. Penn. He graduated from Dickinson college in 1827, studied theology at Princeton, and in 1832 went to the Sandwich islands as a missionary. In the Hawaiian government he was minister of instruction, presided over the board of education, and acted as privy councillor.

**ARMSTRONG, Sir WILLIAM GEORGE**, noted for various mechanical inventions, especially in artillery and in water-power machinery, was b. in 1810 at Newcastle, where his father was an eminent corn-merchant, and in 1851 filled the office of mayor. A. was

educated at the school of bishop Auckland; but his peculiar mental powers were chiefly cultivated by the opportunities which his father's tastes gave him, at home, of acquainting himself with chemistry, electricity, and mechanics. Though the natural bent of his mind was to some profession in which these sciences would have been available, he readily yielded to his father's wishes, and was articled to Mr. Armourer Donkin, an eminent solicitor in Newcastle, who, at the expiration of his time, adopted him as a partner. A high sense of duty enabled A. to give his excellent general powers of mind to business; but he devoted much of his leisure to his favorite pursuits, and his inventive faculty was constantly active. About 1838, observing one day a little stream descending along a height near Newcastle, and driving but a single mill, he thought to how much more purpose it might be applied hydraulically, and thus was led into a course of experimenting, which resulted in his producing a much improved hydraulic engine, of which a description was given in the *Mechanics' Magazine* for April 18, 1840. Following up this invention with a view to practical applications, he gave to the world, in 1845, a hydraulic crane, which has proved to be of eminent utility in raising weights at harbors and in warehouses. The discovery of electricity in steam by a workman at a fixed engine on the Cramlington railway in 1840 had meanwhile led A. into a new path, and in 1842 he brought to perfection an apparatus for producing electricity from steam, which was soon after introduced into the Polytechnic institution in London. The evolution of the electricity depending in reality on the friction sustained by the small quantity of water which accompanies the steam in its discharge, the great merit of A.'s invention in this case lay in the form he gave the orifice through which the steam passed. This and other inventions brought him into prominent notice; he was elected a member of the royal society in 1846; and, shortly afterwards, in conjunction with some friends, commenced the Elswick engine-works, in the suburbs of his native town. This establishment is upon a large scale, at first chiefly employed in producing hydraulic cranes, engines, accumulators, and bridges, for use in Great Britain, the continent, and India, but now embracing also works for the production of ordnance.

In 1854, while war was raging in the Crimea, the war office was solicited by many inventors to make trial of new forms of cannon and projectiles. Mr. Armstrong, one of the number, attracted the attention of the authorities, and was employed to make explosive apparatus for blowing up the ships sunk at Sebastopol. This led him soon afterwards to consider improvements in ordnance, and he devised a form of breech-loading cannon, combining many peculiarities in structure and action. He received encouragement to make a few field-pieces on his new method. He made lengthened experiments on the strength of iron and steel, on the relative merits of cast and wrought iron, on the best number of grooves in rifling, on the best pitch or twist for these grooves, on the most convenient modes of loading at the breech of the gun, on the mechanism for lessening the recoil, on the best form and structure of shot and shells, and on the fuses best suited for igniting the shells during their flight.

Most of the early experiments were made with guns throwing 6-lb. and 18-lb. shot and shells, and subsequently 32-lb. shells. The last-named gun was built up piecemeal, to avoid flaws or faults, and to insure strength, lightness, and durability. It was made in 3-ft. lengths. Bars of wrought iron, 2 in. wide, were heated to whiteness, twisted spirally round a steel bar or core, and welded; other bars were twisted over these in a similar way, but with an opposite turn of the spiral; a third and perhaps a fourth were added, according to the thickness and strength needed. Another heating to whiteness preceded a thorough welding of all the layers of bars by a steam-hammer. The ends of two of these 3-ft. pieces were then nicely trimmed and adjusted, placed in contact, and bound together by the enormous pressure of a wrought-iron ring shrunk on while at a white heat. By varying the number and length of these sections, a gun of any length could be made. The core was then removed, and the bore of the gun rifled by exquisite machinery. The rifle-grooves were so small and close as to be upwards of 40 in number; their pitch or twist such as to make a complete circuit in a gun 10 ft. long. The breech of the gun was wholly distinct, and constructed in a different way; it could be drawn backwards by unscrewing, and had a hole through its center for introducing the shot or shell and the charge. At first, the inventor adopted a steel interior for his gun; but afterwards relied on the toughest wrought-iron. The projectile employed with this gun might be solid shot, shell, case-shot, or canister-shot; but the shell was that to which most interest is attached. It was about 3 diameters in length; and thus a 32-lb. shot or shell could be fired from a gun of much smaller caliber than if it were spherical. The shell was built up of about 50 separate pieces of cast-iron, very accurately fitted, and enveloped in an iron sheath. Outside of it were two bands of lead, soft enough to be forced into the rifled grooves of the gun, and thus to acquire the rotatory movement by which the straightness of flight is so much insured.

The actual results obtained by a gun such as is above described are almost incredible. An ordinary long 32-pounder weighs 57 cwt.; Armstrong's 32-pounder weighs 26 cwt. The former requires 10 lb. of powder as a charge; for the latter 5 lb. will suffice. The former will send a shot or shell 3000 yards; the range of the latter exceeds 9000 yards. The fuses attached to the shells are so exquisitely adjusted that the shell can be made to burst either directly on leaving the gun, or half-way on its path, or when it strikes an object; in the last-named case, even a sack of shavings will afford the necessary concus-

sion; and yet, so close is the structure, that an uncharged shell has been fired completely through 9 ft. of solid oak, without the pieces separating. A.'s elaborate experiments were made chiefly with a 6-pounder, 1½ in. caliber, and so light that two men could carry it (without its carriage); this small gun could reach 1500 yards with wonderful accuracy of aim, and had a range of 3000 at a certain elevation.

When A. had spent much of his time and thoughts during four years on this subject, the government, supported by the strongly expressed opinions of artillery officers of all ranks, proposed to secure the result of these experiments for the nation. A. offered to the government, without any stipulation, not only all his past inventions, but also all such as he might hereafter discover. This led to arrangements which the ministers in parliament characterized as liberal and patriotic on his part; and the terms thus suggested were accepted. An office was created for him, that of chief engineer of rifled ordnance, for seven years provisionally; and a certain amount of salary was determined on, in consideration at once of his past inventions and of his future services. He was knighted by the queen in 1858.

The peculiar connection, partaking in some degree of the nature of a partnership, between the government and the Elswick firm, underwent changes from time to time, and was brought to a close in 1863. During its continuance, guns of gradually increasing power were made on A.'s system; 3, 5, and 12 pounders; then 18, 20, 32, and 40 pounders; then rapidly increasing in caliber, until at length a 600-pounder was produced, weighing upwards of 20 tons. The coil system of construction, the adoption of a large number of rifle grooves, and the use of the beautifully formed segment shell, were continued; but A. made variations in the combination of steel and iron, and adopted muzzle-loading for many of his larger guns. Elaborate experiments made by the war office led to a conclusion that the A. breech-loader has many disadvantages for large ordnance. Notwithstanding its range, accuracy, power of working in a small space, easiness to clean, and safety to the gunners while loading, it is neither so cheap nor so simple as the muzzle-loader; it is difficult to handle, complicated, apt to get out of order, and not so useful for general purposes. The comparative cheapness has had much to do with the preference of the war office for the Woolwich gun, a muzzle-loader. A. supplies and has long supplied many foreign governments with his guns, chiefly of large caliber. The manufacture is of the highest order, effected through the medium of machine tools of exquisite construction; but the practical utility of the gun, as compared with the Whitworth, Palliser, and other kinds, is still matter of controversy.

The great reputation and commercial success of A. depend on his skill as a constructor of water-power machinery. Early in his career, in 1847, when a plan was adopted for supplying Newcastle with water, he suggested that the power derived from the descent of the water through pipes from the reservoir should be utilized for working hydraulic cranes on the quay, and for various mechanical purposes in the town; this was done with marked success. The system has rapidly grown; until, at length, the A. hydraulic machinery is largely adopted in England and abroad for raising, lowering, hauling, and other purposes in connection with railways, canals, docks, piers, harbors, lock-gates, manufactories, warehouses, etc. The fabrication of the machinery employs a very large number of hands at Elswick, where the works are carried on by a joint-stock company. A., who belongs to several scientific societies, was in 1863 elected president of the British association; he was instrumental in bringing about the appointment of the coal commission in 1866. He has also taken an active part in the inquiries concerning the operation of the patent laws. Cambridge and Oxford have conferred honorary degrees on A., who is a member of several foreign knightly orders.

ARMSTRONG, WILLIAM JESSUP, D.D., 1796-1846; b. N. J.; an American Presbyterian clergyman. He was pastor of the first Presbyterian church in Richmond, Va., 1824-34; afterwards secretary of the American board of commissioners for foreign missions until his death. His life and sermons have been published. He lost his life by the wreck of the steamboat *Atlantic* on Long Island sound.

ARMY. Referring to ARMIES (ANCIENT, MEDIEVAL, and MODERN) and to BRITISH ARMY for brief historical notices of national military forces, and leaving to other portions of this work all details concerning the formation and tactics of such forces, it may be well to mention here certain distinctions in the application of the name A. A *covering* A. is encamped or in cantonments, for the protection of the different passes of roads which lead to the town or other place to be protected. A *siege* A. is ranged around or in front of a fortified place, to capture it by a regular process of besieging. A *blockading* A., either independent of or auxiliary to a siege A., is intended to prevent all ingress and egress at the streets or gates of a besieged place. An A. *of observation* takes up an advanced position, and by celerity of movement keeps a close watch on all the maneuvers of the enemy. An A. *of reconnaissance* has a more special duty at a particular time and place, to ascertain the strength and position of the enemy's forces. A *flying* A. comprises a strong body of horse and foot, moving quickly from place to place, to alarm the enemy, and to protect garrisons. Any one of these may be forced into an engagement in the field; but they are all more or less subsidiary to the *main* A., by which the greater operations in the field are usually conducted.

**ARMY ADMINISTRATION.** The whole of the operations connected with the raising, clothing, paying, maintaining, and controlling of the British army, are included in the term A. A. They are distinct matters from military command and discipline. The sovereign has the supreme command of the British army; but the secretary of state for war is her responsible representative in all that concerns administration—the commander-in-chief being her representative in matters relating to military command and discipline. The secretary is the organ through whom the wishes of the sovereign are reconciled with the wishes and intentions of parliament. Until the war with Russia in 1854, the administrative departments were much scattered; their defective organization led in great part to the miseries suffered by the British troops in the Crimea; but now they are all consolidated under the secretary of state for war. See WAR DEPARTMENT.

**ARMY AGENT.** See AGENT, ARMY.

**ARMY ESTIMATES.** In the spring of every year, the British government having formed a plan concerning the extent and appliances of the military force for that year, the war office sends to the treasury a series of accounts setting forth the probable cost of everything required. The accounts are called the A. E. If they are approved by the treasury, the chancellor of the exchequer adverts to these, along with other estimates, in his annual "financial statement," made to the house of commons in his capacity as guardian of the public purse. In preparing the A. E. the secretary of state for war applies to the heads of all the departments under him for detailed accounts of their probable requirements. Another functionary then incorporates and adjusts these into a whole; they are submitted to the treasury; and, if approved, are presented to the house as the A. E. Should the commons grant the money, the accountant-general of the war office makes the requisite drafts or demands from time to time; and the treasury authorizes the paymaster-general of the forces to honor these drafts. The money itself is in the bank of England; this establishment receives a certain annual sum from the government for managing such financial matters.

The A. E. are drawn up in conformity with a model which differs little from year to year. There are certain great headings, each comprising many minor divisions: viz., 1. *Regular forces* (4 votes); 2. *Auxiliary and reserve forces* (4 votes); 3. *Ordnance establishments and manufactures, and purchases of stores* (4 votes); 4. *Works and buildings* (barracks, fortifications, etc.); 5. *Educational establishments* (schools, libraries, etc.); 6. *Administration of the army*; 7. *Non-effective services* (half-pay, retiring allowances, pensions, etc.). The various items are more or less sifted by the house of commons; and any one or more of them can be refused altogether, or granted in diminished amount. The A. E. for 1879-80, which may be cited here as an illustrative example, refer to the period from April 1, 1879, to Mar. 31, 1880. The total number of men, including the staff of the militia forces, on the home and colonial establishment of the army, and exclusive of those serving in India, was 135,625. The total number serving in India was 62,653, which are charged against the Indian treasury. The horses were 26,218, of which 10,830 were for India service. Without going into any details, we will simply give the amounts under the six great headings:

1. Regular forces—pay and allowances.....	£4,944,300
2. Auxiliary and reserve forces.....	1,258,500
3. Ordnance services (provisions, clothing, arms, stores).....	5,531,000
4. Works and building.....	853,300
5. Various services (education, administration, etc.).....	432,900
6. Non-effective services.....	2,625,800

£15,645,700

**ARMY LIST** is the name of a publication issued monthly by authority of the war office. It contains the names of all commissioned officers in the British army. Then come the general and field officers of the dying-out Indian army. Next the names of all officers who hold military honors or staff appointments. The bulk of the work, however, is taken up with an enumeration of all the regiments in the queen's army, and all the officers in each regiment, arranged according to the numerical rank of the regiments. To this are added lists of the officers of the rifle brigade, colonial corps, royal artillery, royal engineers, royal marines, control, and army medical department; and of officers retired on full-pay and on half-pay. Next follow the officers of the militia, yeomanry, and volunteers; and then the militia and volunteer officers of the several colonies. A full index, an obituary, a list of the changes gazetted during the past month, and of the new regulations, complete the work. A larger work of similar but non-official character, *Hart's A. L.*, by a more condensed arrangement of type, gives all the information contained in the official list, and much in addition.

**ARMY REGISTER**, the official list of the United States army, published annually, showing the position, rank, and duties of officers, regiments, companies, etc., with the promotions and casualties during the preceding twelve months.

**ARMY SCHOOLS.** The colleges, academies, and schools relating to military matters in this country may be grouped into three classes—those intended to increase the military efficiency of the officers and men; those for imparting military knowledge to per-

U. K. I.—45

sons not yet in military service; and those which bear relation to the ordinary school-tuition of soldiers of the ranks and their children. The principal of those in the first group are the staff college, the royal military college at Sandhurst, the school of military engineering at Chatham, the department of artillery studies at Woolwich, the school of gunnery at Shoebury, the school of musketry at Hythe, and the royal artillery institution at Woolwich. The second group is represented by the royal military academy at Woolwich; while in the third are the royal military asylum (better known as the duke of York's school) at Chelsea, the royal Hibernian school at Dublin, the regimental schools, and the garrison schools. Chelsea hospital is an asylum for veterans, not a school of instruction. See MILITARY ACADEMY, MILITARY SCHOOLS, SANDHURST, etc.

ARMY, UNITED STATES. See UNITED STATES ARMY.

**ARMY WORKS CORPS.** When the British generals engaged in the Crimean war, in the later months of 1854, knew that the siege army would need to winter outside Sebastopol, grave difficulties were presented to their notice. The distance from the landing place at Balaklava to the front of the siege-camp was not less than 8 miles; and the only road was a mud track, almost impassable in wet weather. How to get the heavy guns, the shot and shell, the provisions, and the general stores up to the front, was a question not easy of solution. The British soldiers were too few even for the ordinary military duties, and yet they were called upon for services of an extra and arduous nature. When these facts became known in England, a suggestion was made that an "army works corps" should be formed, to consist of strong and efficient railway excavators, Cornish miners, and well-sinkers; that these should have with them all the tools and appliances for making roads and digging wells; and that they should be accompanied by travelling workshops and skilled artisans, to effect that which might require more skill than physical labor. The immediate necessities of Lord Raglan, in regard to bringing up supplies, were met by the construction of a railway from Balaklava to the heights outside Sebastopol, by special contract with Messrs. Peto and Brassey; but the large amount of bodily labor continually needed for various services, led to the formation of the A. W. C. The raising and organization of this force were intrusted to Sir Joseph Paxton. As soon as he had obtained 1000 efficient men, he sent them out; and their value was so soon felt by Lord Raglan, that other detachments gradually followed, until the corps comprised 3500 men in the later months of 1855. The men were paid well, and they worked well; and as their engagement related only to the special duties connected with the siege-camp, the country was not saddled with any burden after the need for these services had ceased. They did not require to be drilled for their duties, like sappers; and they were ready for work at once, as artisans or laborers. There were some cases of disagreement between the men and their employers, after the whole of the British had returned from the Crimea, in a matter of wages due; but this was a question of detail, and did not affect the usefulness of the corps. The experience was valuable, as showing the relative advantage and disadvantage of employing civilian laborers in military operations. As one result, it may be observed that the military authorities have been careful not to repeat the experiment in later wars.

**ARMY-WORM**, in the northern states the larva of a noctuid moth, *heliophila unipunctata*. It grows to nearly 2 in. in length; its appearance varies with the successful moultings, as is common with caterpillars, but when grown it is dark gray marked with three yellow stripes above, and a broader one of the same color along each side. The moth is light chocolate brown, bearing a white dot in the center of each fore-wing. Two generations appear each summer; occasionally in so great numbers as to cause serious damage. Their ravages may be checked in a measure by surrounding the field where they are found by a double furrow, or a ditch, and crushing those that fall in.

The southern army or cotton worm, *aletia argillacea*, is a much more troublesome visitor. The larva is a semi-looper, yellowish green; the segments of the body are ornamented with black dots, appearing as warts under the microscope, some of them supporting hairs. In some specimens a dorsal line is visible. There are three broods in the same season, and the latter is often very destructive to the cotton plant. The imago somewhat resembles that of the northern worm, but is slighter, and lacks the white dot. It flies as far n. as the great lakes.

**ARNAUD, HENRI**, 1641-1721; historian of the Vaudois, pastor and painter; a native of Piedmont. Encouraged by the English revolution and the enthronement of William III., and probably with pecuniary assistance from England, A. undertook to bring back to their native valleys the Vaudois expatriated by Victor Amadeus of Savoy. In Sept., 1689, he led about a thousand of the exiles into the valley of the San Martino, though opposed by a superior force; but being in danger of attack by 20,000 troops, he retired to the high table-land of the Balsille, making such fortifications as he could. Here he was assaulted, May 2, 1690, by 22,000 French, whose failure was so complete that A. lost not a man, while the French were almost decimated. A. did not risk another fight, but withdrew to Angona, and, just when final capture seemed assured, he learned that war was begun between France and Piedmont, and that the Piedmontese king had suddenly become a friend of the exiles, ready to receive them. The Vaudois were at

peace in their valleys until the war of the Spanish succession began, when A. and his men did good service against France; but when that was over, the king of Piedmont again leagued with France against them, and 3000 Vaudois were expelled, finding an asylum in Würtemberg. A. was invited to England by William III., but preferred to remain pastor among his exiled countrymen at Schönberg, where he wrote his *Histoire de la Glorieuse Rentrée des Vaudois dans leurs Vallées*, dedicated to queen Anne.

**ARNAULD, ANGÉLIQUE**, a daughter of Robert Arnauld d'Andilly, was b. on the 28th Nov., 1624. From her earliest years she exhibited an extraordinary force and resoluteness of character, and excited much anxious speculation concerning her future career among her relatives. When not quite twenty years of age, she became a nun at Port Royal des Champs, where she had been educated by her aunt, Marie Jaqueline Angélique Arnauld, sister of the great Arnauld. Nine years after, she was made subprioress; and on removing some years later to Port Royal de Paris, she held the same office. During the persecution of the Port Royalists, A. A., by her piety and courage, sustained the spirit of the sisterhood. The whole family, male and female, were determined Jansenists, and none more so than mother Angélique de Saint-Jean (her conventual name). She had much to endure, but she met misfortunes with earnest intrepidity. A royal order was issued to break up the nunnery. The police arrested the inmates, who were dispersed in various convents throughout France, and constant efforts were made by the Jesuits to induce them to sign the "formulary of Alexander VII." A. A. was alone exempted from listening to their arguments and solicitations, her "obstinacy" being supposed invincible. At length, by command of the archbishop of Paris, the nuns were restored to Port Royal des Champs; but for some years they were subjected to a strict surveillance by soldiers, who watched all their movements, and allowed them no intercourse with persons out of the convent. In 1669, however, was issued the edict of Clement IX. for the peace of the church, which was a kind of compromise on this vexed question of Jansenism and Jesuitism. The nuns received back the privileges of which they had been stripped, and constituted their society anew. A. A. was again elected prioress. In 1678, she was made abbess. The next year, her protectress, the Duchesse de Longueville died, and the persecution recommenced by the prohibition to receive any more novices. Still Angélique did not despair. She consoled the nuns, and exerted all her influence with persons in power, but with little effect. At last she sank under a complication of griefs, and expired on the 29th of Jan., 1684, leaving behind her as bright and beautiful a memory as any of her countrywomen. She was learned without being pedantic, pious without bigotry, and gentle to others in proportion as she was severe to herself. A. A. wrote several works, the most valuable of which is *Mémoires pour servir à la Vie de la Mère Marie Angélique Arnauld de Sainte Madeleine, Réformatrice de Port Royal*.

**ARNAULD, ANTOINE**, the greatest advocate of his time in France, was b. at Paris in 1560. He was descended from an ancient family of Auvergne, which had distinguished itself both in civil and military affairs. A. was not less remarkable for his eloquence than for his probity. His zealous defense of the university of Paris against the Jesuits in 1594 won for him a wide celebrity. It was reprinted in 1717. He published another work against the society of Jesus, and several tractates of an earnest political character. The Jesuits accused him of being a Huguenot, but the accusation was unfounded, for he had no personal predilection in favor of Protestantism as a distinct religious system. He had several children, who formed the nucleus of the Jansenists and Port-Royalists. He d. 29th Dec., 1619.

**ARNAULD, ANTOINE**, known as "the great A.," the twentieth and youngest son of the preceding, was b. at Paris, Feb. 6, 1612. Although originally intended for the bar, he could not conceal his dislike of the legal profession, and was in consequence dedicated by his mother to the service of the church. Entering the sorbonne, he became a pupil of Lescot, the confessor of cardinal Richelieu, and afterwards bishop of Chartres. Lescot initiated him into the scholastic theology; but his attention having been drawn to the writings of Augustine, he soon conceived an admiration for that profoundest of the early Christian thinkers which he ever after retained. It was Augustine, he himself admitted, who first showed him the great difference between the two states—that of a nature whole and sound, and that of a nature corrupted by sin. In 1641, the sorbonne wished to receive him into their society, on account of his extraordinary piety and talents, but cardinal Richelieu opposed this. In the following year he was ordained a priest, and in 1643 he published a work entitled *De la Fréquente Communion*, which was received in the most favorable manner by all except the Jesuits, who had taken alarm at the virtues of A., and were already attempting to defame one whom they instinctively felt to be a reproach to their order. As a consequence of this publication, he was now admitted "of the society" of the sorbonne. A. not only replied to the aspersions of the Jesuits in his *avertissement*, but also sent forth a work which was the prelude to a long and fierce contest with his adversaries, *Théologie Morale des Jésuites* (Moral Theology of the Jesuits). But the hatred of the latter was not confined to literary libels; they advised the chancellor of the sorbonne to carry the dispute to Rome, whither A. would be obliged to follow and defend himself. In this scheme, however, they were defeated.

A. now buried himself in ~~seclusion~~ seclusion for 21 years, during which period, however, his

pen was almost continuously active. In 1644 appeared his *Tradition de l'Eglise sur la Penitence* (Opinion of the Church on the Doctrine of Penitence). It was a reply to the attacks which the Jesuits had made against his *Frequent Communion*. A. was still entangled in the disputes which arose out of this treatise, when he became involved in another controversy that colored the whole of his subsequent career, and may be said to have won for him his position in history. This was the great Jansenist controversy. In 1640 had appeared a posthumous work of Jansenius, bishop of Ypres, entitled *Augustinus; seu Doctrina Sancti Augustini de Humana Nature Sanctitate, Aegritudine Medicata, adversus Pelagianos et Massilienses*. It laid down with a rigor equal to that of Calvin the doctrines of predestination, the corruption of human nature, and the depravity of the will. It was specially intended as a counteractive against the lax principles and morality of the Jesuits, many of whom, and especially their great champion, Molina, entertained extreme Pelagian views of the freedom of the human will, which they had cunningly interwoven into their "scarlet-colored" web of ethics. The work, in the meantime, was condemned by pope Urban VIII., on the 1st of Aug. 1641. A., who quickly apprehended its vital importance in the existing state of things, boldly ventured to defend it against the censures of the papal bull. He published several pamphlets, closing with a first and second *Apologie de Jansenius*. It is to the honor of the religion of A., however, that it was not always controversial. Whenever a moment of armistice was permitted him, he occupied it in writing such works as *Mœurs de l'Eglise Catholique*, *La Correction*, *La Grâce*, *La Vérité de la Religion*, *De la Foi*, *de l'Espérance*, *et de la Charité*, and the *Manuel de Saint Augustine*. He also varied these occupations by translating into Latin his *Frequent Communion*, and by the composition of his *Nova Objectiones contra Renat, Descartius Meditationes*, and several smaller tractates. In addition to his literary labors, he undertook the direction of the nuns of Port Royal des Champs, a convent of which his sister, Marie Jacqueline Angélique Arnauld, was abbess. In this retreat he was surrounded by many friends, thirsting like himself for the quiet pleasures of study, some of whom have left their mark in the world, such as Pascal, Nicole, etc. Here they wrote in common numerous excellent works. A. executed parts of the *Grammaire Générale Raisonnée*, *Eléments de Géométrie*, and *L'Art de Penser*. In 1649, the Jansenist controversy broke out more fiercely than ever. The *Augustinus* of the bishop of Ypres was again attacked and condemned by the sorbonne and the pope. A. replied in his *Considérations*. In 1650 appeared what he conceived to be his best work, *L'Apologie pour les Saints Peres*. For the next half-dozen years he was engaged in constant and painful disputes; yet, in spite of the polemical character of his life, the impression of his piety and earnestness was deepened in the mind of the nation; and on reading some of his compositions, even Alexander VII. is reported to have praised the author, and to have exhorted him for the future to despise the libels of his adversaries. During the strife he published *La Concorde des Evangiles* and *L'Office du Saint-Sacrement*. In 1655-56, for prudential reasons, he left his retreat at Port-Royal; about the same time he was expelled from the sorbonne and the faculty of theology.

In 1656, the war with the Jesuits was renewed—not, however, by A. in person. An unknown knight with closed visor had ridden into the lists—the great Pascal. Under the name of *plume* of Louis de Montalto, he discharged his scorpion wit against the Jesuits for about a year and a half in the *Provincial Letters*. A. furnished him with materials; but, in 1658, he took the field in *propria persona*, by publishing his *Cinq Ecrits en faveur des Curés de Paris contre les Casuistes relâchés*. In 1662 appeared *La Nouvelle Hérésie* (of the Jesuits); in 1669, the first volume of his *Morale Pratique* (of the Jesuits), the last of which was not published until the year of his death.

A., who was a sincere Catholic after his fashion, next had a theological controversy, properly so called, with the reformed minister Claude, the consequence of which was his volume *Du Renvolement de la Morale de J. C. par la Doctrine des Calvinistes touchant la Justification* (1672). In 1675, he returned to the subject in his *Impiété de la Morale des Calvinistes*. Some years previous to this, A. had enjoyed the peace of Clement IX., which put a stop for the time to the Jansenist controversy. He had been presented to the papal nuncio and to the *grand monarque*, both of whom flattered him highly; but the Jesuits, who could not breathe freely in his presence, used their utmost efforts to prejudice Louis against him, and at last the king issued an order for his arrest. A. hid himself for some time, but finally withdrew into Belgium. He felt his exile keenly, though honored by many learned and influential persons, and could not rest in one city, but wandered from place to place, ever displaying the same astonishing vigor of mind and the same polemical tendency. It is strange that this man, who was celebrated amongst his friends for equanimity and gentleness of heart, should have been so bitter in his controversies, even with his friends, for he wrote not against his enemies only, but against Pascal, Domat, Nicole, his protector, pope Innocent XI., and his old friend père Malebranche. So earnest was he for the truth—which earnestness had no doubt been greatly intensified by persecution and controversy—that he could never thoroughly realize the idea that there might be truth on the other side also. He d. at Brussels, 8th Aug., 1694. His works, which amount to upwards of 100 volumes, were published at Paris, 1775-83.

ARNAULD, HENRI, 1597-1692; bishop of Angers. He abandoned the bar for the pulpit, and in 1645 was mediator between Innocent X. and the Barberini (a powerful

family, one of whom was a cardinal), and for his success a medal was made and a statue set up in his honor. In 1649, he was made bishop, and became a strong Jansenist, being one of the prelates who refused to sign an acceptance of the bull against that heresy. He was remarkable for close attention to duty, limiting his sleep to five hours. His *Negotiations at the Court of Rome* furnishes five volumes of curious information and gossip.

ARNAULD, JACQUELINE MARIE (usually called by her name in religion, MARIE ANGÉLIQUE DE SAINTE MAGDELEINE), b. 1591; second daughter of the celebrated advocate, Antoine Arnauld. In her 9th year she assumed the dress of a novice; and, concealing her age, her father induced the pope to nominate her abbess of Port Royal when she was a little over 11 years old. At first she disliked her situation, but a sermon in 1608 fully converted her, and she passed at once to the severest convent discipline. She speedily became famous for piety, and when Madame d'Estrées, abbess of Maubisson, was removed for gross misconduct, Angélique received charge of the convent. In 1623, she returned to Port Royal, and three years later the community removed to the house known as Port Royal de Paris, where she fulfilled a long cherished desire in resigning her dignity of abbess. She was afterwards superior of a new religious community in Paris; then prioress at Port Royal, where her sister Agnes was abbess; and in 1648, she, with a few companions, did much kindness to the poor who were oppressed by the civil wars. She d. in 1661, just before the storm of persecution reached her home.

ARNAULD, ROBERT D'ANDILLY, the eldest son of Antoine Arnauld, the advocate, and brother of the great Arnauld, was b. at Paris in 1588. He was a person of considerable consequence at the French court, where his influence was ever exerted beneficially. Balzac spoke very highly of him. At the age of 55 he quitted the bustle of the world for the solitude of Port-Royal des Champs, where he devoted himself to religious history and biography. His chief works are translations, such as those of the *Confessions of St. Augustine*, and of the *History of the Jews*, by Josephus. The latter work is esteemed more elegant than accurate, however. In 1668 appeared his translation of the *Lives of the Holy Fathers of the Desert*, and of several *Saints*; and in 1670, that of the works of St. Theresa. He was likewise the author of some pieces of religious verse. He d. 27th Sept., 1674.

ARNAULT, VINCENT ANTOINE, 1766-1834; a French dramatic author. In 1797, the first council sent him to the Ionian islands on diplomatic business, and for a time he lived in Venice. That city suggested *Les Vénitiens*, produced in 1799, and favorably received, particularly by Napoleon, before whom A. gave lectures on the old city of the doges. He was advanced by Napoleon to offices in the academy and the university. Besides his early tragedies, *Marius à Minturnes*, *Lucrece*, and *Les Vénitiens*, he wrote works in prose, poems, fables, and *Vie Politique et Militaire de Napoléon*, and assisted in the *Nouvelle Biographie des Contemporaines*.

ARND, or ARNDT, JOHANN, a German Protestant divine, b. at Ballenstadt, in Anhalt, in 1555, became Lutheran pastor at Quedlinburg, Brunswick, and elsewhere, and d. at Celle, Hanover, in 1631. As a man he was remarkable for his piety and active benevolence; but he is chiefly known for a work entitled *True Christianity* (*Wahres Christenthum*), which was translated into most European languages, and is yet popular in Germany. Its object is "edification"—the promotion of practical religion; and it is written with great warmth and unction, and in a strain of piety bordering on mysticism. It has been called the Protestant's Kempis, and its author the Fenelon of the Protestant church. There is an English translation by W. Jaques (Lond., 1815, 2 vols.).

ARNDT, ERNST MORITZ, professor in the university of Bonn, and for half a century one of the leading political writers of Germany, was b. in the island of Rügen in 1769. He gave up the clerical profession, for which he was at first intended, and, after traveling over great part of Europe, became, in 1806, professor of history in Greifswald. Here, among other writings, he published his *History of Serfdom in Pomerania*, for which he was formally denounced and accused by several nobles. In his *Spirit of the Times* (Altenb., 1807), he attacked Napoleon with such boldness, that, after the battle of Jena, he had to take refuge in Stockholm. Returning under a feigned name, he resumed his functions at Greifswald in 1810; but war becoming imminent, he resigned the following year, and became an active co-operator with the minister Von Stein, and other patriots, in throwing off the foreign yoke. His numerous fugitive writings, full of energy and fire, contributed not a little to rouse and sustain the spirit of Germany for the war of liberation. His best poems belong to this period, and several of them have become national songs. (A new selection, Leip., 1850.) His song, *What is the German's Fatherland?* is sung wherever German is spoken. In 1818, he was made professor of modern history in the new university of Bonn; but became involved in 1819 in the prosecutions for what were called "demagogic movements," and was suspended. Though acquitted on trial, he was made to retire, retaining his salary. After twenty years' suspension, he was restored in 1840. His writings are numerous: we may mention his *Beschreibung und Geschichte der Schottländ. Inseln*, etc. (Leip., 1826); a collection of his fugitive *Schriften für und an meine lieben Deutschen* (3 vols., Leip., 1845); and *Erinnerungen aus*

*dem äussern Leben* (3d ed., Leip., 1842). He was elected a member of the German national assembly in 1848, but seceded from it along with the whole Gagern (q.v.) party in 1849. He powerfully supported the party who advocated a constitutional hereditary monarchy, and took a prominent part in the appointment of the archduke John as regent, and in the fruitless deputation to Berlin to offer the empire to the king of Prussia. After the dissolution of the Frankfort assembly, A. did not cease in his fugitive writings to advocate the views of the German national party. He d. 29th Jan., 1860.

**ARNE**, THOMAS AUGUSTINE, doctor in music, one of the best and most genial of English composers, was b. in London, 1710, and received his early education at Eton. His father, who was an upholsterer, intended to educate him for the bar; but the love of music was too strong to be restrained. Young A. became skillful as a violin-player, forming his style chiefly on the model of Corelli; and his zeal in the study of music induced his sister (afterwards celebrated as Mrs. Cibber) to cultivate her excellent voice. He wrote for her a part in his first opera, *Rosamond*, which was first performed with great success in 1733. Next followed his comic operetta, *Tom Thumb, or the Opera of Operas*; and afterwards his *Comus* (1738), which displayed greater cultivation of style. He married a singer, Cecilia Young (1740); and after a successful visit to Ireland, was engaged as composer to Drury Lane theater, and wrote many vocal pieces for the Vauxhall concerts. The national air, *Rule Britannia*, which was originally given in a popular performance, *The Masque of Alfred*, was of his composition. He composed also two oratorios, the opera *Eliza*, and another, *Artaxerxes*, in the Italian style; but his genius was better adapted to simple pastoral melody than to great dramatic compositions. He d. in London, 1778.

**ARNEE**, or ARNA, the largest animal of the ox kind yet known. It is a native of India, and is found chiefly in the forests at the base of the Himalayas and in the north-eastern provinces, never descending to the low plains. It is usually regarded by naturalists as a wild variety of the buffalo; but Mr. Vasey thinks "our information on the subject not yet sufficiently precise to determine this point." It is named *bos arnee*, as a distinct species, by some authors. A pair of horns in the British museum measure more than six feet each along the outer curve. When the head of an A. is placed with the muzzle on the ground, it requires the outstretched arms of a man to hold the points of the horns. From the manner in which the A. is introduced in Indian paintings, it would seem to have been sometimes tamed.

**ARNHEIM**, or ARNHEM, the Roman Arenacum, capital of the province of Guelderland, in Holland, with a pop. of (74) 36,004, is situated on the right bank of the Rhine, which is here crossed by a bridge of boats. It has a considerable transit-trade between Amsterdam and Germany. The environs of this strongly fortified town are exceedingly picturesque. Among its most remarkable buildings are the Reformed Dutch church, which contains monuments of the dukes of Guelderland; and the town-house, noted for the grotesque adornment of its front, which has gained it the name of Duivelshuis. There are several paper-mills in the neighborhood. Here Sir Philip Sidney d. in 1586, after the battle of Zutphen. In 1813, A. was taken by storm by the Prussians, under gen. Bulow, and the way thus prepared for the occupation of Holland.

**ARNHEM LAND**, a name formerly applied to a region in north Australia, so called from the ship of the Dutch navigators who discovered it in 1618.

**ARNICA**, a genus of plants belonging to the natural order *compositæ*, sub-order *corymbifera*. The flowers of the ray are female and ligulate, those of the disk hermaphrodite and tubular. The receptacle is naked; the pappus hairy. The root, leaves, and flowers of the mountain A. (*A. montana*), sometimes called mountain tobacco, are much valued in medicine, and administered in various forms as a stimulant in paralytic affections, typhoid fevers, and other diseases. They are also applied with much benefit to bruises, to promote the re-absorption of extravasated blood. They contain a peculiar volatile oil, a resin, an extractive matter, and an alkaloid (*arnicina*). The root is perennial and crooked, the stem about 2 ft. high, simple or little branched, with few leaves, bearing on the summit a head of flowers of a dark golden yellow, often 2 in. in breadth. It flowers from June to Aug., forms an ornament of mountain meadows in Germany and Switzerland, and is found upon the continent as far s. as Portugal, and as far n. as Lapland, but is not a native of Britain.

**ARNIM**, ELIZABETH VON, better known as Bettina, wife of Ludwig Achim von Arnim (q.v.), was b. in 1785, at Frankfort-on-the-Maine. From her childhood excitable and eccentric, an early and profound impression was made upon her mind by the suicide of her friend, the canoness von Gunderode. The next great event of her life was her devoted attachment to, and intimacy with, Goethe, at that time a man of nearly 60. Their correspondence, entitled *Goethe's Letters to a Child*, was published in 1835, and translated by Bettina into English. Her letters are poetical, graceful, and fascinating, though often careless and extravagant, and abound in graphic sketches of men of the time. Goethe turned many of these letters into verse. Bettina's later works were semi-political in their character, and, like her earlier, full of fantastic beauty. She lived to a good old age, dying in 1859.

ARNIM, GISELA VON, a German authoress, daughter of Bettina von A. and wife of Hermann Grimm. She is known by her dramatic works.

ARNIM, KARL OTTO LUDWIG VON, a well-known writer of travels and other works, was b. at Berlin, 1779. After studying at Halle and Göttingen, he traveled at different times over the most of Europe, and was employed on the embassies at Stockholm and London. His *Flüchtige Bemerkungen eines flüchtigen Reisenden* (Passing Remarks by a Passing Traveler, 6 vols., Berl., 1837-50) is recommended for its clear, elegant style, as contrasted with the lumbering and involved writing of the "academic" school. A. also wrote in English *Napoleon's Conduct towards Prussia* (Lond., 1814), and published *German National Melodies*, with German and English text (Lond., 1816). He was the author of a play and several poems. He d. in 1861.

ARNIM, LUDWIG ACHIM VON, a fantastic but original German writer of romances, was b. in Berlin, Jan. 26, 1781. After devoting some years to the study of the physical sciences, he began his career as an imaginative author with *Ariel's Revelations*, a romance which, though based on the principles of the new poetic school which had then risen in Germany, indicated, nevertheless, that the author could strike out a way of his own. His travels through Germany afforded him an opportunity of catching the peculiarities of popular life in its various provincial manifestations. He was especially interested in the old popular poetry, and stirred up among his countrymen a warmer sympathy for it by the publication, along with Clemens Brentano, of *The Boy's Wonderhorn* (Heidelberg, 1806-8). In 1809 appeared the *Winter Garden*, a collection of novels; in 1810, the romance entitled *The Poverty, Riches, Guilt, and Repentance of the Countess Dolores*; in 1811, *Halle and Jerusalem, the Sports of a Student, and the Adventures of a Pilgrim*, in which last his humor took a very saucy turn. In 1817, he published the *Crown Guardians*, a work characterized by its originality, richness of fancy, and vivid portraiture. The later years of his life were spent partly in Berlin and partly at his estate near Dahme, where he d. Jan. 21, 1831.

ARNIM, or ARNHAIM, JOHANN GEORG, Baron von, 1586-1641; a diplomat and general in the thirty years' war. He was in the Swedish army under Gustavus Adolphus, but, though a Protestant, Wallenstein, in 1626, induced him to join the imperial side, and to become his close friend and ally. After Wallenstein's dismissal, A. went over to the elector of Saxony, and led the left wing of the Saxon and Swedish armies in the battle of Leipsic. Upon Wallenstein's restoration, in 1632, the old friends were opponents in the field; but as little was done by either, they were suspected of playing into each other's hands. Wallenstein was assassinated in 1634, and A. began active operations, gaining a great victory at Liegnitz; but after the peace, not deeming himself properly honored by the elector, he retired to his castle, where he was taken by the Swedes and imprisoned in Stockholm. He escaped, but died very suddenly while raising an army to revenge his wrongs.

ARNO, next to the Tiber the most considerable river of central Italy, rises on Mt. Falterona, an offset of the Apennines, at an elevation of 4444 ft. above the level of the sea, and 25 m. n. of Arezzo. It flows through the deep and fertile valley of Casentino, in a s.e. direction; enters the richly cultivated plain of Arezzo, where it receives the water of the Chiana; then flows in a n.w. and n. course through the upper valley of the A. (Valdarno), one of the most delicious parts of Tuscany; afterwards it receives the Sieve, its largest tributary, and turns its course toward the w., flowing past Florence, Empoli, and through the t. of Pisa. The whole length of its course is about 140 miles. In old times, the embouchure of the A. was of Pisa; now it is about 4 or 5 m. distant, in lat. 43° 41' n., and long. 10° 15' e. It is navigable for barges as far up as Florence, but in the summer season even this frequently becomes impossible. The Italian poets speak of "the golden A.," but, in truth, its waters have mostly the unpleasant color of milk and coffee mixed together. The A. is noted for the rapid and destructive character of its inundations. The most memorable are those of Sept., 1537, when the whole of the Valdarno was laid under water, which rose to the height of 8 ft. in some parts of Florence; and of 1740, the latter being caused by the long continuance of the sirocco, which completely melted the snows on the Apennines.

ARNOBIUS, called AFER, and sometimes "the elder," an early Christian writer, about the first part of the 4th c., a native of Numidia, in Africa. He was a teacher of rhetoric, and at first an opponent of the Christians, but was converted in his early years. His fame rests chiefly upon his great treatise in seven books entitled *Adversus Gentes*, in which he answers the complaint against the Christians, that the calamities and disasters of the time were due to their impiety, and had come upon men since the establishment of the Christian religion. A.'s views were tinged with gnosticism and dualism.

ARNOLD, or ARNALD, of BRESCIA, was a native of that t., and was distinguished by the success with which he contended against the corruptions of the clergy in the early part of the 12th century. He was educated in France under Abelard, and adopted the monastic life. By his preaching, the people of his native place were exasperated against their bishop, and the fermentation and insurrectionary spirit spread over a great part of the country, when he was cited before the second Lateran council, and banished from Italy. He retired to France, but experienced the bitter hostility of St. Bernard, who

denounced him as a violent enemy to the church. He thereupon took refuge in Zurich, where he settled for several years. Meanwhile his doctrines exerted a powerful influence in Rome, which ended in a general insurrection against the government, whereupon A. repaired thither, and endeavored to lead and direct the movement. He exhorted the people to organize a government similar to the ancient Roman republic, with its consuls, tribunes, and equestrian order. But they, provoked by the treachery and opposition of the papal party, and disunited among themselves, gave way to the grossest excesses. The city, indeed, continued for 10 years in a state of agitation and disorder. Lucius II. was killed by the populace in an insurrection in 1145, and Eugenius III., to escape a similar fate, fled into France. These violent struggles were subdued by pope Hadrian IV., who, feeling the weakness of his temporal authority, turned to the spiritual, and resorted to the extreme measure of laying the city under excommunication, when A., whose party became discouraged and fell to pieces, took refuge with certain influential friends in Campania. On the arrival of the emperor, Frederick I., for his coronation, in 1155, A. was arrested, brought to Rome, tried, hanged, his body burned, and the ashes thrown into the Tiber.

ARNOLD, BENEDICT, b. Conn., 1740; d. England, 1801. Soon after the revolution broke out he was commissioned a colonel in the service of Massachusetts, and late in 1775 led a force of 1000 men through the pathless northern forests with the intention of capturing Quebec. At the St. Lawrence river he joined gen. Montgomery, and the attack was made and failed on the last day of the year, A. being severely wounded in the fight, and Montgomery killed. He was made brigadier-general, and in 1776 displayed much skill and courage in a naval fight on lake Champlain, though he was not victorious. It has been surmised that A.'s life and actions were influenced by disappointment in not being made one of the first five major-generals, though he was the next one to receive that rank, in 1777. He was in the battle of Bemis heights, after which he had a quarrel with Gates, who seems to have been jealous of him. In the conflict at Stillwater he fought as a volunteer without command, rushing into the thickest of the fight with the utmost bravery. Here he was again wounded, and forced for some months to retire. In 1778, he commanded in Philadelphia, where he lived extravagantly and went into debt. In 1779, he married the daughter of Shippen, afterwards chief-justice of the state. Charges were made against him, and he was sentenced by court-martial to be reprimanded by the commander-in-chief. Washington was as mild as possible, but A. was greatly chagrined, probably the more so because he had for several months been contemplating treason. In Aug., 1780, he asked, and obtained, command at West Point, the most important patriot fortress, which he offered to surrender to Sir Henry Clinton. The accidental capture of major André, the British messenger, Sept. 23, frustrated the scheme, and A. hastily escaped to the sloop-of-war *Vulture*. He immediately went into the British service and commanded an expedition against Virginia, but did little except destroy property along James river. The only acts of importance for which he was responsible were the burning of New London, and the massacre of the garrison at fort Griswold after the surrender. Near the close of the war he went to England, where he seems to have been held in no high esteem. He was in New Brunswick, in trade, in 1790-92, but soon went back to London, where he died.

ARNOLD, EDWIN, an English author, b. 1831. He taught school in Birmingham, and was president of a Sanskrit college in India, resigning in 1860. His work has been chiefly in periodical literature, though he has produced *Griselda, a drama; Poems, Narrative and Lyrical; Education in India*; a translation of the *Euterpe* of Herodotus; and a metrical translation of *The Hitopadesa*, from the Sanskrit. After his return to England he published a *History of Lord Dalhousie's Administration*, and another volume of poems. He was a correspondent of the *London Telegraph* during the war of the rebellion in the United States, sympathizing entirely with the loyal states, and predicting their triumph. At the death of Thornton Hunt he became chief editor of the *Telegraph*. While at this exacting work he found time to translate a volume of Grecian poems, and to produce his most remarkable work, *The Light of Asia*, a production notable for its exquisite poetry and lofty philosophy, and the vividness and reality with which the scenery, climate, manners, and people of Hindustan, as they were 2000 years ago, have been portrayed. Its full title is *The Light of Asia; or The Great Renunciation; being the Life and Teachings of Guatama (as told in verse by an Indian Buddhist)*.

ARNOLD, JOHANN, a miller of Neumark, who lived in the time of Frederick II. of Prussia, and gave rise to a remarkable legal process. He complained to the king that his landlord, by making a pond, had taken away water from the mill; that he (A.) had therefore refused to pay rent for the mill, of which he held a lease; but had been condemned to pay by the unanimous decisions of two legal courts. The king took up the case, and regarding it as an oppression of the poor, reversed the decisions of the courts, dismissed his high-chancellor, imprisoned several other officers of justice, and gave orders that restitution should be made to the miller. Soon afterwards, the king died, and under Frederick William II. the case was more coolly investigated, when the result was that the condemned chancellor and other official persons were exonerated from all blame in the matter, and the miller was recompensed by the state for loss of time and money.

ARNOLD, JONATHAN, 1741-98; an American surgeon in the revolution. He was a member of the first colonial assembly of Rhode Island; served medically in the patriot army; and was a member of the continental congress, in 1782-84. Late in life he removed to St. Johnsbury, Vt., and was for several years judge of the Orange county court.

ARNOLD, MATTHEW, a living English poet, the eldest son of the late Dr. Arnold of Rugby, was b. 24th Dec., 1822, and educated at Winchester and Rugby. In 1840 he was elected scholar of Balliol college, Oxford; in 1844 he obtained the Newdigate prize; and in 1845 he was elected a fellow of Oriel college. In 1851 he was appointed one of her majesty's inspectors of British schools. In 1857 he was elected professor of poetry at Oxford, and in 1859-60 was sent to the continent by the English government as assistant to the commissioners appointed to inquire into the state of education in France, Germany, and Holland. In 1865 he again visited the continent on a like mission. A. holds the honorary degrees of Edinburgh and Oxford, and an Italian order.

Mr. A. was first known as a poet of classic taste and exquisite purity of imagination, but of late years he has almost exclusively betaken himself to prose. His chief productions in verse are *Poems* (1853), containing, among other fine pieces, *Sohrab and Rustum*, *Tristram and Yseult*, *Balder*, and *Merope* (1858), an attempt to naturalize in English literature the form of the Greek drama; and *New Poems* (1867). His prose writings are growing numerous. Among the chief are his lectures on *Translating Homer* (1861); his *Report on Education in France, Germany, and Holland* (1861); *A French Eton or Middle-class Education and the State* (1864); *Essays on Criticism* (1865); *Lectures on the Study of Celtic Literature* (1867); *Schools and Universities of the Continent* (1868); *Culture and Anarchy, an Essay in Political and Social Criticism* (1869); and *Higher Schools and Universities in Germany* (1874). In *St. Paul and Protestantism* (1870), and still more in *Literature and Dogma* (1872), he startled the public by his piercing and audacious application of literary criticism to religion. In 1875, he published *God and the Bible*; in 1877, *Last Essays on Church and Religion*.

ARNOLD, RICHARD, b. 1828; an American general, native of Rhode Island. He graduated at West Point in 1850, entering the artillery. In the war of the rebellion he rose to brigadier-general of volunteers, and in 1866 was made brevet major-general of the regular army.

ARNOLD, SAMUEL, 1740-1802; an English composer; educated under Dr. Nares in the chapel royal, and at 20 years of age appointed composer at Convent Garden theater. Here, in 1765, he produced *The Maid of the Mill*. In 1776 he became composer to the Haymarket; in 1783 was appointed composer to the king, and ten years afterwards organist in Westminster abbey, where he was buried. Among his works are *Inkle and Yarico*, *Rosamond*, *The Battle of Herham*, *The Mountaineers*; and in sacred music, *The Cure of Saul*, *The Prodigal Son*, *Abimelech*, and *The Resurrection*. He left unfinished an edition of Handel's works.

ARNOLD, THOMAS, D.D., head-master of Rugby school, and the author of a *History of Rome*, was b. June 13, 1795, at west Cowes, in the Isle of Wight. In 1803 he was sent to Warminster school, in Wiltshire, but was removed in 1807 to the public school of Winchester, where he remained till 1811, when he was elected a scholar of Corpus Christi college, Oxford. In 1815 he was elected fellow of Oriel college, and he gained the chancellor's prize for the two university essays, Latin and English, for the years 1815 and 1817. As a boy, we are told he was shy and retired; as a youth, disputatious, and somewhat bold and unsettled in his opinions; but before he left Oriel, he had won the good opinion of a college which at that time boasted of such names as Copleston, Davison, Whately, Keble, Hawkins, and Hampden. He took deacon's orders in 1818, and the year after settled at Laleham, near Staines, where he occupied himself in preparing pupils for the university. In 1820 he married Mary, youngest daughter of the Rev. John Penrose, rector of Fledborough, in Nottinghamshire, and sister of one of his earliest school and college friends, Trevenen Penrose. About ten years were spent in this quiet and comparatively obscure life; he was preparing himself for the arduous post he afterwards occupied; he was maturing his opinions, and he had also already commenced his great literary undertaking, the *History of Rome*. It was a period which he himself was accustomed to look back upon with some feeling of regret. His letters at this epoch reveal to us a fine ambitious spirit bending cheerfully to the task of tuition, more useful than glorious; they also prove to us that those views of a religious and political character which afterwards distinguished him, were being matured in the privacy of Laleham. "I have long had in my mind," he thus writes to a Mr. Blackstone, "a work on Christian politics, or the application of the gospel to the state of man as a citizen, in which the whole question of a religious establishment, and the education proper for Christian members of a Christian commonwealth, would naturally find a place. It would embrace also an historical sketch of the pretended conversion of the kingdoms of the world to the kingdom of Christ in the 4th and 5th centuries, which I look upon as one of the greatest *lours d'adresse* that Satan ever played. . . . I mean that by inducing kings and nations to conform nominally to Christianity, and thus to get into their hands the direction of Christian society, he has in a great measure suc-

ceeded in keeping out the peculiar principles of that society from any extended sphere of operation, and insuring the ascendancy of his own." He here expresses, in a somewhat sportive and familiar manner, the great principle which he afterwards contended for with so much earnestness, that there should be a Christian laity, a Christian legislature, a Christian government; by which he did not mean a system of laws or government formed in the manner of the Puritans, out of texts of Scripture, rashly applied, but imbued with the *spirit* of the New Testament, and of the teaching of Christ.

It was at Laleham also that A. first became acquainted with Niebuhr's *History of Rome*. This was an era in his life. It produced a revolution in his historical views, and his own *History of Rome* became modeled almost too faithfully on that of the great German.

From Laleham he was called to undertake the arduous duties of the head-mastership of Rugby school. On these he entered Aug., 1828. Our space does not permit us to dwell upon the details of that system of public education which he perhaps carried to its perfection. We can only take notice of the high tone, moral and religious, which he preserved amongst the boys. He had the tact to make himself both loved and feared. He guided with great dexterity the *public opinion of the school*. "In the higher forms," says his biographer, "any attempt at further proof of an assertion was immediately checked. 'If you say so, that is quite enough; of course I believe your word;' and there grew up in consequence a general feeling that it was a shame to tell A. a lie—he always believes one." On one occasion, when he had been compelled to send away several boys, he said: "It is *not* necessary that this should be a school of 300, or 100, or of 50 boys, but it is necessary that it should be a school of Christian gentlemen."

But the school was very far from occupying the whole energies of A. The *History of Rome* went on; he took part in all the great questions of the day, political and theological. In politics he was a whig, without being fettered—as we need hardly say—by the ties of party. In the theological discussions of the day, he was chiefly distinguished by the broad views he had adopted of the nature of a Christian church. As already intimated, it was his leading idea that a *Christian people* and a *Christian church* ought to be synonymous expressions. He would never tolerate that use of the word church which limited it to the clergy, or which implied in the clergy any peculiar sacredness, or any traces of mediatorial function. The *priest* was unknown to him in the Christian community; this placed him at once in antagonism to the high church party; and even clergymen of the low church complained that he did not set sufficient value on their sacred order. But all men, of whatever party, admitted and admired the zeal with which he taught that the full spirit of Christianity should permeate the whole of our civil or political life. If he seemed to lower the altitude of the clergy, it was only because he would raise the general level of the laity. He was convinced that "the founders of our present constitution in church and state did truly consider them to be identical, the Christian nation of England to be the church of England; the head of that nation to be, for that very reason, the head of the church." It may be doubted whether this is quite historically correct; but it certainly presents a noble theory to the imagination.

In domestic life, Dr. A. was most happy; here he was distinguished by unflinching cheerfulness and amiability. In 1832, he purchased Fox How, a small estate between Rydal and Ambleside, and it was in this charming retreat that he enjoyed in the vacations, amongst the family circle, his own uninterrupted studies. Fox How has become a classical spot to every tourist.

For a brief time he held a place in the senate of the London university; he resigned the seat on finding that he could not introduce some measures which he had at heart. In the year 1842, he received from lord Melbourne the offer of the regius professorship of modern history at Oxford. This appointment he accepted with peculiar gratification. He delivered some introductory lectures, which were heard with enthusiastic interest; and it was his intention, on his retirement from Rugby, to enter with zeal upon the duties of his professorship. But this and all other literary enterprises were cut short by a sudden and most painful death. The last vacation was at hand, the journey to Fox How was to be taken in a few days, when he was seized with a fatal attack of spasm of the heart. Few biographies end more abruptly or more mournfully; but the sufferer met his death with perfect fortitude and the full hope of a Christian. He died June 12, 1842. His principal works are *five volumes of sermons*; the *History of Rome* (3 vols.), broken off by his death at the end of the second Punic war; and an edition of *Thucydides*. See *Life and Correspondence of A.*, by Rev. A. P. Stanley, M.A., now dean of Westminster (1845).

ARNOLD, THOMAS KERCHIEVER, 1800-53; an English clergyman and author of books on the study of languages. In 1838 appeared the first of his elementary series for Greek, Hebrew, Latin, and several modern tongues, which was followed by school classics, all of which became popular in both England and the United States.

ARNOTT, NEIL, M.D., was b. in 1788 at Arbroath, but his family home was Dysart, near Montrose, Scotland. He was educated at the grammar school of Aberdeen, and subsequently at Marischal college in the same city, where he had the advantage of studying natural philosophy under prof. Copland, one of the most successful expounders of mechanical science then living. A. made choice of medicine as a profession; and after going through the medical course at Aberdeen, he went to London in 1806, where

he became the pupil of Sir Everard Home, surgeon of St. George's hospital. After spending some years in the naval service of the East India company, he settled in 1811 as a medical practitioner in London. In addition to his extensive general practice, A. was appointed, in 1815, physician to the French embassy, and afterwards to the Spanish embassy. In 1836, Dr. A. was appointed a member of the senate of the university of London, then established by government. He was afterwards elected a fellow of the royal society, and then of the geological society. In 1837, he was named a physician extraordinary to the queen.

In 1823-24, Dr. A. was induced to deliver a course of lectures on natural philosophy in its applications to medicine. The substance of these lectures formed the basis of his *Elements of Physics, or Natural Philosophy, General and Medical*, published in 1827. Of numerous new applications of physical science to medical practice, and to the alleviation of human suffering in general, invented by Dr. A., may be mentioned the water-bed (q.v.). But it is in connection with improvements in the warming and ventilating of houses that the name of Dr. A. is most extensively known. In 1838, he published a treatise on *Warming and Ventilating*; and in 1855, another *On the Smokeless Fireplace, Chimney-culves, etc.* The "Arnott stove" and "Arnott ventilator," which, with characteristic philanthropy and disinterestedness, Dr. A. refrained from patenting, are noticed under WARMING AND VENTILATION. In 1861, he published *A Survey of Human Progress*, full of interesting and enlightened views on improvement generally. In 1864, appeared Part I. of the long-promised revision of the *Physics*; this was followed by Part II., which contains the subjects of optics and astronomy for the first time, and also an interesting supplement entitled *Arithmetic Simplified*. A.'s last publication was a small work on national education. He d. in London Mar. 2, 1874. In the year 1859, he expressed a wish to a friend to make a contribution to Marischal college, Aberdeen, in aid of a course of lectures on natural philosophy, to be available to young men not regular students of the university. The union of the two Aberdeen colleges interfered with the project; and a few years later he gave £1000 to the united university, to provide a scholarship in natural philosophy. This was followed by the same gift to each of the other three Scottish universities, and, for Aberdeen, a further gift of £500 to the mechanics' institution. In London, Mrs. Arnott had already given £1000 to each of two colleges for young ladies, to constitute scholarships for natural philosophy. In 1872, Dr. A. intimated through Dr. Lyon Playfair that he meant to repeat his gift to the Scottish universities; but, in consequence of a fall, his faculties had been permanently impaired, and he was no longer capable of continued thought or decision. An attack of cold in 1858 had permanently affected his hearing; but otherwise, his last years were characterized by his usual flow of spirits. A.'s genius showed itself in a very unusual combination of inventive power with the art of popular exposition. His bent of mind was strongly towards human improvement in every department of thought and conduct.

**ARNOTTO**, ARNATTO, ANNOTTA, ANNATTO, or ROUCOU, also known on the continent of Europe by the name of ORLEAN, is a red coloring matter, which is obtained in South America and the West Indies from the reddish pulp surrounding the seeds of the Arnotto-tree (*Bixa orellana*) by washing, maceration, fermentation, and subsequent evaporation. It appears in commerce in cakes or balls of 2 to 4 lbs. weight, wrapped up in leaves, externally brown, internally of a pale blood-red or yellowish-red color, and which have a peculiar animal smell and an astringent taste. Pure A. seldom appears in the market. It is obtained by the mere rubbing off and drying of the red pulpy pellicle which covers the seed; but that which is thus obtained is very pure, and occurs in small round or angular lozenges. The Indians rub this coloring matter into the skin of their whole body, thus intending both to adorn themselves, and to obtain protection against the bites of mosquitoes. Amongst us, A. is used in medicine for coloring plasters, ointments, etc.; and to a considerable extent by farmers for giving a rich color to cheese. It is also used in dyeing, although it does not produce a durable color. It is employed to impart an orange tint to simple yellows. It is an ingredient in some varnishes. It dissolves in alkalies, producing a brown solution, from which it is precipitated yellow by acids. It imparts little color to water, but dissolves in alcohol; alum and sugar of lead throw down a brick-red precipitate from the alcoholic solution. In South America, A. is very extensively mixed with chocolate, not only for the sake of the color, but also for the improvement of the flavor.—The genus *bixa* belongs to the natural order flacourtiaceæ (q.v.), and is distinguished by complete flowers with simple stigma, a hispid calyx of five sepals, and a two-valved capsule. The A. shrub is a native of tropical America, but has been introduced into other warm countries. It grows to the height of 7 or 8 ft., and has heart-shaped pointed leaves, and large flowers of a peach-blossom color, which grow in loose clusters at the extremities of the branches. The capsules are oblong, and contain 30 to 40 seeds enveloped in red pulp (the A.). The seeds are said to be cordial, astringent, and febrifugal. The roots are used in broth. They have the properties of A. in an inferior degree.

**ARNOULD**, SOPHIE, 1744-1803; a French opera singer. She was the daughter of a hotel-keeper; with a good education, fine voice, and attractive face and form, aided by natural wit, she gained the favor of Madame de Pompadour and other women of the court, and first appeared on the stage at the age of thirteen. She drew around her many

of the leading men of the time, even such as Rousseau, Diderot, and Helvétius, and had a triumphant career for more than 20 years. One of her sons was a colonel, and was killed at Wagram.

**ARNSBERG**, one of the three departments of the Prussian province of Westphalia (q.v.), having an area of 2900 sq. m., and a pop. (1875) of 982,987. With the exception of the valley of the Lippe, the whole department belongs to the highlands of the lower Rhine. Only in a few of the valleys is there good arable soil; on the other hand, there is a great deal of good timber, more than a third of the whole area consisting of forests. But the principal resources of the district are its subterranean riches, in coal, iron, lead, silver, etc. Its abundant water-power has also led to the establishment of numerous factories, mills, etc. **ARNSBERG**, the chief t. of the department, is situated on the Rhur 44 m. s.e. from Münster; pop. '75, 5490. It has several manufactures, such as linen, broadcloth, potash, etc. In the orchard below the castle is still pointed out the spot where the famous Femgerichte (q.v.) of A. was held.

**ARNSTADT**, the chief t. in the principality of Schwarzburg-Sonderhausen, is situated in a picturesque country on the banks of the Gera, 12 m. s. of Erfurt, and has a pop. (1875) of 9243. It is one of the oldest Thuringian cities, its existence being traceable as far back as 704 A.D. Formerly it was the chief emporium for the trade in fruit and timber between the fertile lowlands and the Thuringian forest region, but is now a manufacturing town, employing a very considerable number of hands in weaving, glove-making, brewing, pottery, etc. A rich vein of rock-salt has been recently discovered in the neighborhood of the t., and a new copper-mine opened.

**ARNSWALDE**, or **ARENSWALDE**, a t. in the province of Brandenburg, 41 m. s.e. from Stettin; pop. '71, 6522. It is noted for the manufacture of linen and woolen goods, chemicals, and church bells.

**ARNULF**, or **ARNULPHUS**, a king of Germany, great-grandson of Charlemagne. About 894 A.D., he captured Rome, where the pope crowned him as emperor. He died in 899, and his son succeeded him as Louis IV.

**AROKSZALLAS**, a t. of Jazygia, Hungary, 44 m. n.e. from Pesth, and an entrepôt for the trade between that city and upper Hungary. It stands in a plain on the Gyöngöys Patak, a small stream, by which it is almost encircled. The surrounding country is fertile, and affords excellent pasture. Pop. '69, 8170.

**AROLSEN**, a t. in Waldeck, on the Aar, 12 m. n. from Waldeck; pop. '67, 2148. It has many works of art, and a fine library of about 30,000 vols. Kaulbach, the painter, was born here.

**AROMA**, a term sometimes employed to designate those substances the extremely minute particles of which are supposed to affect the organ of smell so as to produce particular odors, and frequently as synonymous with *odor*. The particles diffused through the atmosphere, and affecting the olfactory nerves—if the theory of particles of matter so diffused be correct—must indeed be extremely minute, as odoriferous substances such as musk, the smell of which is felt at a considerable distance, continue to diffuse their odor, and according to this theory, these particles, for years, without sensible diminution of weight. See *Nose*, etc. The term A. is usually employed only with reference to particular kinds of odors, not easily defined or distinguished in words. Thus, we speak of the A. of roast-meat, and of the A. or *aromatic* smell of hyssop, mint, and other plants. Aromatic smells are very characteristic of some natural orders of plants, as *labiate* (mint, etc.) and *compositæ* (milfoil, etc.). They have been very generally supposed to depend upon essential oils; but resins are often equally aromatic.

**AROMATICS** constitute a class of medicines which owe their properties to the essential oils, to benzoic and cinnamic acids, to volatile products of distillation, or to odorous glandular secretions. The plants that contribute to this class of medicines are those which yield essences, camphor, or odorous resins, and amongst the families which yield the most important aromatics are the *labiata*, *umbellifera*, *lauracea*, *myrtacea*, *aurantiacea*, *conifera*, *scitamineæ*, *orchideæ*, etc. In some cases, the aromatic matter is diffused throughout all parts of the plant, but it is usually condensed in particular organs, such as the root, in the case of ginger and galanga; or the bark, in the case of cinnamon, canella, and cascarella; or the flowers, as in the case of cloves; or the fruit, as in the case of anise and vanilla; or the wood, as in the case of sandal-wood and aloes-wood; or the leaves, as in the case of most of the *labiate*, *umbellifera*, etc.

A. may be arranged in the following sub-classes: (1) Those in which the active principle is an essential oil, as the oil of thyme, lavender, cajeput, neroli, fennel, etc. (2) Those containing camphor, or an allied body, such as artificial camphor obtained from turpentine. (3) Bitter aromatics, in which there is a mixture of a bitter principle and an essential oil, as chamomile, tansy, wormwood, etc. These are tonics and vermifuges. (4) Those of which musk is the type, such as civet and amber; and certain plants with a musk-like odor, such as *malva moscata*, *minulus moschatus*, and *hibiscus abelmoschus*. (5) Those containing a fragrant resin, as benzoin, myrrh, olibanum, storax, and the balsams of Peru and tolu, which possess stimulant properties. (6) Lastly, those which are artificially produced by destructive distillation, as tar, creosote, benzol, or the various empyreumatic oils.

As a general rule, these substances act as diffusible stimulants of more or less power, and as antispasmodics, while those in which a bitter principle is present act as vermifuges and tonics. The whole class were formerly regarded as possessing disinfectant and antiseptic properties, and there is no doubt that some, as coal-tar, creosote, etc., strongly possess this property. In this country we usually associate aromatics with other medicines; but in France aromatic infusion, lotions, baths, etc., are much prescribed. It will suffice to give the composition of aromatic infusion as an illustration. Take equal parts of the leaves of sage, ordinary and lemon thyme, hyssop, origanum, wormwood, and mint. Infuse 50 parts of these leaves in 100 parts of boiling water.

**AROMATIC VINEGAR** differs from ordinary vinegar (which is acetic acid diluted with water) in containing certain essential oils which impart an agreeable fragrance. It is generally prepared by adding the oils of cloves, lavender, rosemary, and *acorus calamus* (and sometimes camphor) to crystallizable acetic acid, or by distilling the acetate of copper in an earthen retort and receiver, and treating the liquid which passes over with the fragrant oils mentioned above. A. V. is a very pleasant and powerful perfume; it is very volatile, and when snuffed up by the nostrils is a powerful excitant, and hence is serviceable in fainting, languor, headache, and nervous debility. A. V. is generally placed on a sponge in a smelling-bottle or in a *vinagrette*; it can also be purchased as a liquid in vials; and a drop or two allowed to evaporate into a sick room overpowers, but does not destroy, any unpleasant odor. The liquid must, however, be cautiously dealt with, as it is a very corrosive substance.

**ARONA**, a t. in Piedmont, on the w. shore of lake Maggiore, with a dockyard on the lake, gymnasium, hospital, and a number of churches, in one of which is an altarpiece by Gaudenzio Vinci; pop. 3443. The town has trade with Germany and Switzerland. There is a statue here to count Carlo Borromeo, who was born in the now ruined castle in 1538, and canonized for piety and benevolence. It is of bronze and copper, 110 ft. high, including the pedestal of 44 ft. It is hollow, and four persons can stand in the head, where they get an extensive view through the eyes.

**ARONIA**. See **CRATÆGUS**.

**AROOSTOOK**, a river which, rising in the n. of Maine, falls into the St. John in New Brunswick, after a course of about 120 m. It possesses a historical interest from its connection with the long-agitated question of the n.e. boundary between British America and the United States.

**AROOSTOOK**, a co. in the extreme n.e. of Maine, bordering on British America; 6300 sq. m.; pop. '70, 29,609. The surface is rough, and there are several mountain-peaks. The St. John's river forms the eastern boundary, and is navigable for light vessels. There are also the Aroostook, the Mattawamkeag, and several smaller streams, with many lakes and ponds. Most of the region is still covered with primeval forests. Co. seat, Houlton.

**ARPAD**, the national hero of Hungary, was the son of Amos, the leader under whom the Magyars first gained a footing in Hungary. He was chosen duke on his father's death in 839, and by a course of incessant and mostly successful warfare with the Bulgarians, Wallachians, Moravians, etc., extended the first conquests of the Magyars on all sides. He also made more than one successful incursion into Italy about 900, and returned laden with booty. He died in 907, leaving his son in possession of the supreme command. The A. dynasty became extinct in the male line with Andreas III. in 1301. A. yet lives in the popular songs of the country, and his history, even in the oldest chronicles, is mixed up with a deal of legendary matter.

**ARPAD**, or **ARVAD**. See **ARADUS**.

**ARPEGGIO**, in music, a chord of which the notes are given, not contemporaneously, but in succession. From any one chord, several forms of A. may be produced. Bass-chords thus treated form an *Alberti bass*, so named from Domenico Alberti (1730-1740), a popular singer and player, who often played the bass in this style.

**ARPENT** is the old French land-measure, corresponding to our acre. The name is from the ancient Gallic *aripennis*, which was identified by Columella with the Roman *actus*, or half *jugerum*. Ordinarily an A. may be reckoned as five sixths of an acre; but the precise comparative value of the three most in use will be seen in the following table:

	French hectares.
Acre, English imperial or statute.....	0.40466
Arpent, of Paris.....	0.32400
“ d'ordonnance.....	0.48400
“ common.....	0.40000

**ARPINO**, the *Arpinum* of the ancients, a t. of southern Italy, the birthplace of Cicero and Caius Marius, is situated in the province of Caserta, 65 m. n. by e. of Naples. It stands on the lower ridge of a lofty hill, some 6 m. to the left of the river Garigliano, the ancient Liris. The old t., in early Roman times, was built on the top of a steep rock, forming part of the territory of the Volscians. Many remains of the ancient structures are still to be seen, especially a cyclopean wall, which runs along the northern brow of

the hill occupied by the present t., and extending to the ancient citadel. About the year 188 B.C., the citizens received the freedom of the city of Rome, with all its privileges, and Arpinum, during the later years of the republic, was a flourishing municipal town.

The pop. of A. in '72 was 5836. Manufactures of woolen cloth, parchment, paper, and leather are carried on. The t. has a charming appearance from the highly picturesque character of the surrounding woods and mountains. Iron, white marble, variegated red marble, and marble of a yellowish color, are got in mines and quarries in the neighborhood.

**AR'QUA**, a village in the province of Padua, Venice, 12 m. s.w. of Padua, in the heart of the Euganean hills. Pop. 1200. Petrarch's furniture is still preserved in the house in which he died here (July 18, 1374), and his monument of red marble is to be seen in the churchyard.

**AR'QUEBUS**, or **HAR'QUEBUS**, was the first form of hand-gun which could fairly be compared with the modern musket. Those of earlier date were fired by applying a match by hand to the touch-hole; but about the time of the battle of Morat, in 1476, guns were used having a contrivance suggested by the trigger of the arbalest or cross-bow, by which the burning match could be applied with more quickness and certainty. Such a gun was the A. Many of the yeomen of the guard were armed with this weapon, on the first formation of that corps in 1485. The A. being fired from the chest, with the butt in a right line with the barrel, it was difficult to bring the eye down low enough to take good aim; but the Germans soon introduced an improvement by giving a hooked form to the butt, which elevated the barrel; and the A. then obtained the name of the *haquebut*. Soldiers armed with these two kinds of weapon were designated *arquebusiers* and *haquebutters*—the former were common in the English army in the time of Richard III., the latter in that of Henry VIII.

**ARRACA'CHA**, *Arracacha esculenta*, a plant of the natural order *umbelliferae*, a native of the elevated table-lands in the neighborhood of Santa Fe de Bogota and Caraccas, and of regions of similar climate in other parts of tropical America. It is much cultivated in its native country for its roots, which are used as an esculent. The root divides into a number of parts, which resembles cows' horns or large carrots. When boiled, they are firm and tender, with a flavor not so strong as that of a parsnip. The plant is very like hemlock, and has a similar heavy smell. Humboldt, indeed, referred it to the genus *conium* (hemlock), but it has since been made the type of a new genus. The flowers are in compound umbels, and are of a dull purple color. The A. was at one time very strongly recommended as a substitute for potatoes; it was introduced into Britain through the exertions of the horticultural society, and its cultivation perseveringly attempted; but it has been found unsuitable to the climate of Britain and of other parts of Europe, where it has been tried, perishing on the approach of the frosts of winter without having perfected its roots. The dry weather of summer is also unfavorable to it. The climate of the s. of Ireland resembles that of its native regions more than any other in the British islands. It seems to require a very regular temperature and constant moisture. There are probably some parts of the British colonies in which the A. would be found a very valuable plant. In deep loose soils, it yields a great produce. It is generally propagated, like skirret, by offshoots from the crown of the root. By rasping the root and washing, a starch, similar to arrowroot, is obtained.—There is another species of the same genus, *A. moschata*, a native of the same regions, the root of which is uneatable.

**AR'RACK**, **RACK**, or **RAKI**, is the East Indian name for all sorts of distilled spirituous liquors, but chiefly for that procured from toddy or the fermented juice of the cocoa and other palms, and from rice. The palms in other tropical countries furnish a fermented beverage similar to the toddy of India, and in a few instances also it is distilled, but arrack essentially belongs to India and the adjacent countries. The cocoa-nut palm (*cocos nucifera*) is a chief source of toddy or palm-wine, and is obtained from trees ranging from 12 to 16 years old, or in fact at the period when they begin to show the first indication of flowering. After the flowering shoot or spadix enveloped in its spathe is pretty well advanced, and the latter is about to open, the toddy-man climbs the tree and cuts off the tip of the flower-shoot; he next ties a ligature around the stalk at the base of the spadix, and with a small cudgel he beats the flower-shoot and bruises it. This he does daily for a fortnight, and if the tree is in good condition, a considerable quantity of a saccharine juice flows from the cut apex of the flower-shoot, and is caught in a pot fixed conveniently for the purpose, and emptied every day. It flows freely for fifteen or sixteen days, and less freely day by day for another month or more; a slice has to be removed from the top of the shoot very frequently. The juice rapidly ferments, and in four days is usually sour; previous to that it is a favorite drink known in India by the natives as callu, and to the Europeans as toddy. When turning sour, it is distilled and converted into A., known better to the Hindus by the name of naril, and by the Cingalese as pol or nawasi. A similar spirit is made pretty largely from the magnificent fan-leaved palm, *borassus flabelliformis*, and also from the so-called date-sugar palm, *arenga saccharifera*. Large quantities of arrack are made from fermented rice prepared as

malt—both in India, Ceylon, and Batavia; in the last-mentioned place sugar and molasses are also added to the rice.

It is probable that the use of arrack is more widely diffused among the human race than the produce of the vine (wine and brandy) and of barley (whisky, beer). The date-palm of the Sahara, the oil palm of west Africa, and the cocoa-nut palm of the Pacific islands are made to yield it.

The unscientific method of preparing these alcoholic spirits renders them generally very distasteful to European taste, the process of rectification being rarely, if ever, employed. Some carefully prepared samples of great age, however, find favor, and are used in making punch and other drinks, not only in India and Java, but small quantities also find their way to Britain, for the gratification of palates trained in India. The cocoa-nut tree is especially valuable for this industry, because it bears twelve times in the year after it once begins, and continues to do so for as much as 40 years. It is the rule, therefore, to prevent undue exhaustion of so valuable a tree, to discontinue the collection of juice at intervals, and allow the natural process of fruit-bearing to go on: in this way it is usual to divide the year between the two crops. Of late years a considerable amount of rum has been produced in the East Indies from the sugar-cane, and the molasses yielded by it. This is often called arrack by the natives, and leads to errors as to the statistics of the latter material. The word *saki*, used by the Japanese for rice spirit, seems only an alteration of *raki* or arrack. An imitation A. is prepared by dissolving benzoic acid in rum, in the proportion of 20 grains of the former to 2 lbs. of the latter.

**AR RAGONITE**, a mineral essentially consisting of carbonate of lime, and so agreeing in chemical composition with calcareous spar (q.v.), but differing from it in the form of its crystals, of which the primary form is a rhombic prism with angles of  $116^{\circ} 16'$  and  $63^{\circ} 44'$ , the secondary forms being generally prismatic and pyramidal. The effect of heat on them shows another difference, A. being reduced to powder by a heat in which calcareous spar remains unchanged. Such differences between minerals of the same chemical composition appeared very improbable, and when Stromeyer, in 1813, detected the presence of a little carbonate of strontia in A., they were immediately ascribed to this as their cause; but it has since been shown not only that the quantity of strontia is very small, variable, and therefore to be regarded as accidental, but also that the differences between the two minerals may be accounted for by difference of temperature when crystallization was taking place. A. appears to be the product of a crystallization taking place at a higher temperature than that in which calcareous spar is produced; and accordingly it is frequent in volcanic districts and in the neighborhood of hot springs, as at Carlsbad. It is frequently found in trap-rocks, as in Scotland. It derives its name from the province of Aragon in Spain. It sometimes occurs stalactitic. Its crystals are sometimes prisms shortened into tables, sometimes they are lengthened into needles. Twin crystals (*maeles*) are very common. *Satin spar* is a variety of it, in which the crystals are of a fine fibrous silky appearance, and combined together into a compact mass. *Flos ferri* (i.e., flower of iron) is a name given to a coralloidal variety which sometimes occurs in iron mines.

**AR'RAH**, a t. in the district of Shahabad and the presidency of Bengal, in lat.  $25^{\circ} 31'$  n., and long.  $84^{\circ} 43'$  e. It is situated in a fertile country, and contains, according to the census of '71, a pop. of 39,386. It is on the route between Dinapore and Ghazeeper, 25 m. w. of the former, and 75 e. of the latter. During the mutiny of 1857, A. became in variety and intensity of interest second only to Cawnpore, Delhi, and Lucknow, connected as it was with a heroic defense, a heavy disaster, and a brilliant victory. The defense was that of an isolated house, for eight days, against 3000 Sepoys, with 2 field-pieces, the garrison consisting of less than 20 whites, all civilians, and 50 Sikhs, whose fidelity perhaps was doubtful till proved by trial. The disaster was the nocturnal surprise in the jungle of a detachment almost entirely European, sent to the relief of the beleaguered dwelling—the loss having been 290 out of 415. The victory was won by a force of 172 men, 12 of them mounted volunteers, and 3 guns, over a host numbering nearly 20 to 1. In fact, A., happily with the exception of the cold-blooded massacre of women and children, presented, in miniature, nearly all the phases of the most formidable and eventful insurrection on record. For a detailed account of these events, see *Chambers's History of the Indian Revolt*.

**ARRAIGNMENT**, in the practice of the criminal law in England, means calling a prisoner by his name to the bar of the court to answer the matter charged upon him in the indictment. And having the presumption of innocence in his favor, it is the law, and so laid down in the most ancient books, that, though charged upon an indictment of the highest nature, he is entitled to stand at the bar in the form and in the garb of a freeman, without irons or any manner of shackles or bonds, unless there be evident danger of his escape, or of violence at his hands. When arraigned on the charge of treason or felony, the prisoner is called upon by name to hold up his hand, by which he is held to confess his identity with the person charged. This form, however, is not an essential part of the proceedings at the trial, and it is sufficient for the prisoner, when arraigned, to confess his identity by verbal admission or otherwise. When thus duly arraigned, the indictment is distinctly read over to the accused in the English tongue, and he then either confesses the fact—that is, admits his guilt—or he puts himself upon his trial by a plea of *not*

*guilty*. Formerly, one of the incidents of the A. was the prisoner *standing mute*, as it was called—that is, refraining from, or refusing, a direct answer to the indictment; in which case the court proceeded to inquire whether the silence was of malice on the part of the prisoner, or was produced by the visitation of God, and to deal with him accordingly. But by the 7 and 8 Geo. IV. c. 78, s. 2, it is enacted that where a prisoner shall stand mute of malice, it shall be lawful for the court to order the proper officer to enter a plea of “not guilty,” on which the trial shall proceed, as if the plea had been actually pleaded by the prisoner himself. When there is reason to doubt, however, that the prisoner standing mute is sane or not, a jury consisting of any twelve persons who may happen to be present is forthwith charged to inquire whether he has intellect enough to plead and to understand the course of the proceedings. If they find the affirmative, the plea of “not guilty” is entered, and the trial goes on; but if the negative, the insane person will be ordered by the court to be kept in strict custody during her majesty’s pleasure, according to the 39 and 40 Geo. III. c. 94, s. 2.

By 19 and 20 Vict. c. 16, facilities are provided for the trial of prisoners in the central criminal court, although the offense may have been committed out of the jurisdiction of that tribunal, and it directs the A. to take place in the ordinary form.

In the Scotch criminal law, the expression *calling the diet* corresponds to A. The prisoner is called upon by name by the presiding judge to attend to the indictment against him, which is read aloud by the clerk, and the prisoner is then required to plead, which he does, as in England, by a plea of “guilty” or of “not guilty;” in the event of which latter, the trial proceeds—the prisoner, either by himself or his counsel, having always the last word before the court and before the jury. In this respect, it is only so in England in some cases.

According to Sir Matthew Hale, the term A. is derived from *arraiserer*, *ad rationem ponere*, to call to account or answer, which in ancient French law would be *ad-resoner*, or, abbreviated, *a-resner*. See TRIAL, INDICTMENT, INFORMATION, PROSECUTION, PLEA, VERDICT, NOT PROVEN.

**ARRAN**, an island in the mouth of the Firth of Clyde, Scotland, about 5 m. s.w. of Bute, 13 w. of Ayrshire, and 4 e. of Cantire, from which it is separated by Kilbrennan sound. It is of an oval form, about 20 m. long and 12 broad; area, 165 sq.m., about 15,000 acres, or a seventh part, being cultivated. Pop. ’71, 5234. The general aspect of A. is mountainous and heathy, and in the n., the jagged peaks are singularly grand. Around the coast is a low belt of ground, with lofty cliffs on the s. and s.w., from which the country rises abruptly. The highest point is Goatfell (in Gaelic named *Gaoth Bheinn* or *Beinn Ghaoith*, “Wind mountain”), an obtuse pyramid, 2865 ft. high, and a prominent feature of the island. From its sides slope the romantic glens of Rosa and Sannox, and at its base to the s.e. opens Brodick bay, at the head of which lay, until lately, Brodick village. The houses which composed it have now been removed, and a new village has sprung up on the opposite side of the bay, called Inverclyde, where there is a spacious hotel. To the s. of this, round a bluff headland, is Lamlash bay, the chief harbor of A., and the best on the Firth of Clyde, sheltered by Holy island, once the seat of a monastery. A picturesque mass of columnar basalt, 900 or 1000 ft. high, succeeds. Further s. lies Whiting bay, near which are two cascades 100 and 50 ft. high respectively. At the s.e. point of A. is Kildonan castle, opposite which is the small isle of Pladda, crowned by a light-house. Large caverns occur in the cliffs of the s. and s.w. coasts. In one of these, the “king’s cave,” in the basaltic promontory of Druimodune, Robert the Bruce hid himself for some time. Shiskan vale, opening into Druimodune bay, is the most fertile part of A. Loch Ranza, a bay in the n. end of A., runs a mile inland, and is a herring-fishing rendezvous. There is daily communication with A. by means of steamboats from the Clyde, the ports touched at being Brodick, Lamlash, and Corrie.

The geology of A. is almost unique, and displays a greater succession of strata than any other part of the British isles of equal extent. The s.e. half of A. consists of Devonian sandstone, extending from the e. coast 4 or 5 m. inland, and running s.w. from Brodick beyond the center of the island; and of trap-rocks and carboniferous strata, which occupy the middle and western portions. The n.w. half consists of a central granite nucleus, including Goatfell, bordered on the w. by a tract of mica-slate, and on the n., e., and s. by lower silurian rocks, which, again, have a run of devonian sandstone on the e. and south. Lias and oolite lie on the mica-slate. There are only rivulets in A., and one of them tumbles over a precipice 300 ft. high. Some level parts in the s. half of A. are fertile. The chief crops are oats and potatoes. Cattle, sheep, fish, and oats are exported. The greater part of A. belongs to the duke of Hamilton, whose seat is Brodick Castle. A. forms part of the county of Bute, and contains two parishes. Many antiquities occur, such as cairns, unhewn obelisks, monumental stones, and Druidical circles. Several stone coffins were found in a cairn 200 ft. in circumference. Loch Ranza castle, now in ruins, was once a residence of the Scots kings. See Landsborough’s *Arran*, etc. (1875).

**ARRAN, SOUTH ISLES OF.** These are three small islands lying n.e. and s.w. across the entrance to Galway bay, about 4 m. off the w. coast of Ireland, and 27 w. of Galway city. They form the barony of A., and give the title of earl to the Gore family. Total

area, 11,287 acres. The principal or w. island, Inishmore, is 7 m. long and 2 broad; Inishmaan, or "Middle isle," comes next; and then Inishere to the south-east. Pop. in 1871, 3050, of which number 2122 inhabited Inishmore, 433 Inishmaan, and 495 Inishere. Of the total pop. all but 57 were Roman Catholics; 504 could read and write, 143 could read only, and the rest were illiterate. The islands consist of the carboniferous limestone of the bed of Galway bay, and rise to the height of 100 to 200 ft. on the w. side, ending in cliffs facing the Atlantic. Most of the land is rudely cultivated. The chief crops are rye, oats, and potatoes. Most of the inhabitants engage in fishing; and the *corragh* or wicker-work skiff is still to be seen here. They are subject to famines from parching rainless west winds in August destroying the potato-crop. These islands contained at one time 20 churches and monasteries. Inishmore was the center of these, still known as Aran-na-naomh, or "Arran of the Saints." Many pilgrims still visit the old shrines and relics scattered through the islands. St. Kenanach church, built in the 7th c., still exists, all but its stone roof, as well as the stone oratories and little bee-hive stone huts of the monks of the 6th and 7th centuries. There are nine circular cyclopean fortresses of unhewn uncemented stones (portions of the walls still being 20 ft. high), supposed to have been built in the 1st c. by the Fir-Bolg or Belgæ. The largest of these, Dun-Aengus, on a cliff in Inishmore, 220 ft. high, is one of the most magnificent barbaric monuments in Europe.

**ARRANGING**, a term in music which means the adapting of a piece of music so as to be performed on an instrument or instruments different from those for which it was originally composed, as when orchestral or vocal compositions are set for the piano-forte, or the reverse. An arrangement is often a mere lifeless transposition of the original, the only guiding principle being the mechanical possibility of performance. Of this kind are most of the piano-forte arrangements of the orchestral works of Mozart, Beethoven, etc.—partly from the arranger working merely for hire, and partly from a mistaken reverence for, and fear of altering, the original. It is different when an arranger, who thoroughly comprehends the spirit of the original, takes advantage of the peculiar means of expression afforded by the new form of presentation, to reproduce as much as possible the original effects. In this last respect, the arrangements of Franz Liszt have excelled all others, although in some cases he may have overstepped the boundary of propriety. See POT-POURRI and FANTASIA.

**ARRAS** (the ancient *Nemetacum*), a fortified t. and capital of the department of Pas-de-Calais, as it was formerly of the province of Artois, in France. It is situated on the banks of the Scarpe, partly on an eminence, and partly on a plain, and consists of four divisions—the city, upper town, lower town, and citadel. It is a principal station on the French Northern railway, distant from Paris by this route 134 m., and from Brussels, 97. The pop. in 1872 was 21,447. The houses are of hewn stone, and in the lower town they are handsomely built and uniform; the streets straight and wide, set off with several fine squares and many beautiful public buildings. Among the principal edifices are the cathedral of Notre Dame, the residence of the prefect, the town-hall, the theater, and the public library.

A. ranks as a fortified town of the third class, its fortifications being the first that were constructed by the celebrated Vauban, according to his own system. It has been the seat of a bishop since 390 A.D., and two ecclesiastical councils have been held here—one in 1025, the other in 1490.

The corn-market of A. is the most important in the n. of France. Its principal manufactures are iron-ware, woolen and cotton goods, hosiery, lace, pottery, and leather. Its trade, which is considerable, is in corn and flour, oil, wine, and brandy, with the industrial products of the city.

It appears from the writings of Jerome that A. was remarkable for its woolen manufactures in his time; and afterwards, during the middle ages, it was famed for its tapestry; indeed, the name of the town was transferred to this article of manufacture, and *arras* was the name given in England to the richly-figured hangings that adorned the halls of the kings and the barons.

In 1482, A. with Artois was ceded by the states of the Netherlands to Louis XI. of France; but the inhabitants having revolted, the king laid siege to the town, stormed it, and slew or expelled the people, whom he replaced by others brought from all parts of his dominions, ordering the city to be thenceforward called *Franchise*, to obliterate the very name of A. Soon afterwards (1493) it was ceded to Maximilian of Austria, and was possessed by the Spanish branch of the house of Hapsburg till 1640, when Louis XIII. of France took it after a long siege. By the treaty of the Pyrenees, it was finally ceded to France. A. suffered much in the time of the first French revolution, especially in the year 1793. Robespierre, the terrorist, was a native of the town.

**ARAWAKS**, or LOKONO, a native tribe, once powerful, in Dutch Guiana, but of peaceful character and friendly with whites. Nearly 200 years ago a Roman Catholic missionary undertook to civilize them, mastered their language, and gave them printed works. The family was the foundation of such government as they had, and descent followed the female line.

**ARRAYER**, a title given to certain military officers in England in the early part of the 15th century. There were two of them in each co., sometimes called commissaries of

musters. Their duties were set forth in an ordinance of Henry V., from the terms of which it appears that the arrayers were army inspectors, or, rather, militia inspectors, and in some sense precursors to the modern lord-lieutenant of counties.

**ARREST** is a legal term used both in criminal and civil process. Criminal A. has already been sufficiently considered under the word **APPREHEND** (q.v.); and in civil procedure it may be simply defined to be the execution of a judicial or prerogative order, by which the liberty of the person may be restrained, and obedience to the law compelled. In the practice of the court of chancery, a defendant may be arrested for his contempt in not putting in his answer to a bill filed against him; and persons in all the superior courts may be arrested or attached for contempt. But in its ordinary legal acceptation, A. is used to signify the enforcement of the judgment or order of a court of law, in order to satisfy justice. In the execution of such judgment, the party against whom it has been given may be arrested by means of a writ of *capias ad satisfaciendum*, or a *ca. sa.*, the purpose of which is to imprison the body of the debtor till he pays the debt or damages and costs. It is directed to the sheriff, commanding him to take the body of the debtor, and have him at Westminster immediately after execution thereof, to make the plaintiff satisfaction for his demand. This writ might, at one time, issue for a judgment debt of any amount; but by very recent statutes it was provided that it shall not issue in the case of a debt not exceeding £50, exclusive of costs; subject, however, to this proviso, that where such debt should appear to the judge trying the cause (being a judge of the superior courts, or a barrister or attorney) to have been incurred under false pretences, or with a fraudulent intent, or without a reasonable assurance of being able to pay or discharge the same, it shall be lawful for such judge to order the defendant to be taken and detained in execution upon such judgment, as if the act had not passed. This has since been adopted as the general law applicable to debts of any amount, and the abolition of imprisonment for debt was effected by the debtors act, 32 and 33 Vict. c. 62. No person, since 1869, can be imprisoned in England for making default in payment of a sum of money except in a few rare cases; such as when a court has ordered a sum of money to be paid, and it is not paid, and the debtor has since acquired the means to pay it, but refuses. In such cases the judge may order the debtor to be committed to prison for six weeks or less until the money is paid. So that under this statute of 1869 none can be imprisoned for debt except for some special cause resembling fraud; and even then the imprisonment is limited to one year.

A defendant may also be arrested under a writ of *capias ad respondendum*, which issues as follows: Where a plaintiff swears by affidavit that he has a cause of action against a defendant to the amount of £50 or upwards, or has sustained damage to that amount, that there is reason for believing that the defendant is about to quit the country, and that his absence will be detrimental to the plaintiff's action. An order is made by a judge, when the writ in question issues, directing the sheriff to arrest the defendant, who remains in custody until he has given security in respect of the plaintiff's demand. But this imprisonment cannot exceed six months. This proceeding is now regulated by the absconding debtors act, 33 and 34 Vict. c. 76. Formerly a defendant might be arrested on what is called *mesne process*, that is, process issuing at the commencement and during the progress of a suit; but by recent statutes such A. is abolished, excepting as above explained.

Under such and similar authority, A. may be made of the person. There are classes, however, who are exempted by privilege from A.—thus, ambassadors and other diplomatic representatives of foreign courts; all members of the peerage, Scotch and Irish as well as English; all members of parliament; all persons connected with a cause before a court of justice, and attending in the course of it, such as witnesses, attorneys, and barristers—although, in regard to the latter (barristers), it may be more correctly stated that they are entitled to the privilege only when attending the *superior* courts; and Mr. Archibold, in his *Practice of the Common Law*, refers to a case where a barrister was discharged who was arrested on circuit. The queen may also, by her writ of protection, privilege any person in her service from A. during a year and a day, a prerogative, however, which is seldom, and, at the present day, scarcely ever exercised. In regard to parliamentary exemption from liability to civil process, however, the privilege does not preclude the process from issuing, it only protects the *person* of the member himself; for by 10 Geo. III. c. 50, it is enacted that any action or suit may at any time be brought against any person entitled to privilege of parliament; and that no such process shall at any time be impeached or delayed by pretence of any such privilege, except that the person of a member of the house of commons shall not thereby be subjected to any arrest or imprisonment. It is likewise provided by the bankruptcy act, 1869 (32 and 33 Vict. c. 71, s. 120), that if a person having privilege of parliament commits an act of bankruptcy, he may be dealt with as if he had no privilege. When he is adjudged a bankrupt, he will for one year following be deemed incapable of sitting in parliament unless he satisfy the creditors, and if he do not, then his seat becomes vacant. But now, as all persons, including peers, may be made bankrupt, none is liable to arrest unless he in some way thwart the proceedings in bankruptcy or abscond.

In the Scotch law, the word A. is not a technical term for process against the person. But see **ARRESTMENT**, and **ARRESTMENT FOR FOUNDING JURISDICTION**.

**ARREST** (*ante*). In the United States the laws of arrest are nearly the same as in England. In cases of crime or of a fugitive demanded by the law, any person can make an A. on the spot. In civil matters an A. must be made by an authorized officer, usually a sheriff, or his deputy, or a constable; or in cases in federal court by a marshal; in legislative bodies by a sergent-at-arms. Certain persons and classes are exempt from A., either generally or in special relations indicated; such as ambassadors and their assistants, attorneys duly acting for their clients, persons giving bail for others, clergymen while performing service, voters attending election, insolvent debtors legally discharged, legislators attending the bodies of which they are members, militia while doing military duty, parties to a suit while attending court, witnesses in such cases, and women in certain cases. Civil A. is unlawful on Sunday or on public holidays, or in presence of a court, or in the defendant's residence. Since the very general abandonment of imprisonment for debt, civil A. has become rare, but is resorted to in case of apprehended frauds, such as concealing property, or absconding. For crime, any person is liable to A. except ambassadors and their official assistants; and any necessary force, even to killing, may be used to accomplish the A.; but it is murder to kill the person who is trying to effect the A.

**ARREST OF JUDGMENT**, in the practice of the English common law courts, was an expedient after verdict on the part of an unsuccessful defendant, who endeavored to get the judgment arrested or withheld, on the ground that there was some error which vitiated the proceedings; and if this objection succeeded, it was fatal, no amendment being allowed after trial. But as this rule was found to be productive of great inconvenience, expense, and often injustice, it has been considerably modified by the common law procedure act of 1852 (the 15 and 16 Vict., c. 76), under which, omitted facts or other matter may, by leave of the court, be suggested, by which the error may be corrected. See JUDGMENT.

**ARREST OF JUDGMENT** (*ante*). Where a plaintiff is not entitled to a verdict, a motion for A. of J. is usual; or if no such motion be made, the court may produce the same effect by suspending its own decision. Under A. of J., all the proceedings are set aside, and acquittal is granted; but this does not bar a new indictment.

**ARRESTMENT**, in the Scotch law, is the legal process or diligence, as it is called, by means of which a debtor, where the debt is of a personal nature, is prohibited from making payment or delivery to his creditor until another debt or claim due to the person making use of the arrestment by such creditor is secured or paid. Thus, if A owes £100 to B, but B, again, is indebted to C, arrestment may be used by C in the hands of A; the effect of which is to prevent A paying to B until C's claim has been satisfied. A, the party in whose hands the arrestment is laid, is called the arrestee; C, the user of the arrestment, is called the arrester; and B, the arrester's debtor, is called the common debtor. The arrestment, however, has not the effect of transferring the debt or subject arrested. For that purpose, a particular form of action, called an *action of furthcoming*, is necessary, decree in which operates as a complete transfer to the arrester. This process may be sued out either by authority of the court of session or by that of an inferior judge. The procedure is now regulated by the 1 and 2 Vict. c. 114, ss. from 16 to 22 inclusive.

The corresponding English term is ATTACHMENT OF DEBTS (q. v.).

**ARRESTMENT FOR FOUNDING JURISDICTION**. This is a form of proceeding in the practice of the Scotch law, and it is of an extremely important nature, for, by means of it, a foreigner, or one beyond the jurisdiction of the courts of Scotland, who happens to have any property in that country, may be sued in the Scotch tribunals. It is a personal remedy, and the mode of procedure is thus: The summons (or declaration, as it would be called in England), which is executed by leaving a copy in the proper office in Edinburgh, contains in express terms a warrant to arrest *ad fundandam jurisdictionem*; and when served on the party having possession of the foreigner's property, such warrant has the effect of attaching it, so as to give the court jurisdiction over the foreigner himself. This manner of founding jurisdiction is said to have been borrowed by the Scotch from the lawyers of the Netherlands, and it can be traced back in the practice of the Scotch courts for upwards of a century. In a case, however, brought by appeal to the house of lords from Scotland, an attempt was made to show that for this mode of A. there was no sufficient authority in the law of that country, and it was represented to the house as a barbarous contrivance of comparatively recent introduction. But their lordships had no hesitation in affirming the judgment of the court of session. A like practice exists in London, called foreign attachment, but is peculiar to the city.

**ARRESTMENT OF WAGES** is supposed to exercise a baneful influence on some of the working classes in Scotland, by putting them in the power of greedy and oppressive dealers, who, in the knowledge of the power they thus possess, are too ready to give credit to working-people, and thus encourage them in extravagance. It was the object of so much complaint in Glasgow, that a government inquiry was instituted into its operation in 1853. That inquiry developed a sad amount of extravagance and folly, but did not afford a hope that any mere alteration in the machinery of the law would remedy a deep-rooted social evil. Its most alarming features were found in the female manufac-

turing population, the younger of whom especially, led by avidity for fine clothes, were the victims of a powerful organization of dealers, on what is called the club-ticket system. It is not, however, allowed to arrest wages in summonses for small debts, i.e., under £12. Moreover, the wages of all laborers and work-people were declared by statute 33 and 34 Vict. c. 63, to be exempt from arrestment for debt, except where there was a surplus earned beyond 20s. per week. In England, wages cannot be attached for debt except in one or two exceptional cases.

**ARRHENATHERUM**, a genus of grasses, allied to *holcus* (see **SOFT GRASS**) and *avena* (see **OAT**), and distinguished by a lax panicle, 2-flowered spikelets with two glumes, the lower floret having stamens only, and a long twisted awn above the base; the upper floret perfect, with a short straight bristle below the point.—The name *A.* is from the Greek *arrhen*, male, and *ather*, an awn. *A. avenaceum* (*avena elatior* of Linnæus, also known as *holcus avenaceus*) is a common grass in Britain. It is sometimes called **OAT-LIKE GRASS**, from the resemblance to the coarser kinds of oats in the general appearance of the panicle. In France it is very much cultivated for fodder, and is often called **FRENCH RYE-GRASS**. It has, however, no affinity to the true rye-grass (*lolium*). It is a tall perennial grass, 2 to 3 ft. high, becomes luxuriant early in the season, and continues long productive. It is, however, a rather coarse grass, and has a somewhat bitter saline taste; it is not so acceptable to cattle as many other grasses, and is therefore generally regarded by British agriculturists as unworthy of cultivation on the best soils; but it is found suitable for some comparatively arid situations, and to form a coarse herbage under trees in plantations.—A variety or distinct species, differing from it in having a knotted or bulbous base to the stem, instead of a simple fibrous root, is called by some botanists *A. bulbosum*. It is also common in Britain, but is a very inferior grass, and, owing to the character of its roots, difficult of extirpation from lands in which it appears as a weed.

**ARRHIDÆUS**, PHILIP, a son of the father of Alexander the great by a dancing girl of Larissa. He was at Babylon when Alexander d., 323 B.C., and though almost imbecile was elected king, under the name of Philip, with the understanding that a child (then unborn) of Alexander was to be associated with him in the government. The next year Arrhidæus married Eurydice, who thereafter had complete control over him. Two years later he and his wife were captured by Polysperchon, the leader of the cause of Alexander's son mentioned above, and both were put to death by the order of Olympias, the grandmother of the young king. They were afterwards honored with decent burial, and funeral games were celebrated as memorials of them.

**ARRIA**, the wife of Cæcina Pætus, who, for treason to the emperor Claudius, was ordered to end his own life by suicide. When A.'s husband hesitated, she seized the dagger, drove it to the hilt into her own breast, and then handed it to him, saying calmly, "Pætus, it does not pain me." She fell dead, and the husband at once dispatched himself with the reeking weapon.

**ARRIÂNUS**, FLAVIUS, a native of Nicomedia, in Bithynia, b. about 100 A.D. He became a disciple of Epictetus, the Stoic philosopher, and, under his instructions, a warm advocate of that system. On bringing before the public the earliest products of his pen, the learned men of Athens were highly pleased with them, and honored him with the freedom of their city. A. had chosen Xenophon as his model of composition, and hence the Athenians called him the young Xenophon. In 124 A.D., he was introduced to the emperor Hadrian in Greece, who conferred on him the freedom of the eternal city. He was appointed prefect of Cappadocia in the year 136. Under Antoninus Pius, the successor of Hadrian, he was promoted to the consulship. But some four years afterwards, he appears to have retired from public life, and devoted himself to literature in his native place. As the pupil and friend of Epictetus, he edited the manual of ethics (*Encheiridion*) left by his master, and wrote the *Lectures of Epictetus*, in 8 books, of which only 4 have been preserved—to be had in Schweighäuser's *Philosophia Epictetea Monumenta*, vol. iii. (Paris, 1827). He wrote also *The Conversations of Epictetus*, a work which has been lost, except a few fragments. The most important work by A. is the *Anabasis of Alexander*, or *History of the Campaigns of Alexander the Great*, which has come down to us entire, all but a gap in the 12th chapter of the 7th book. This book is our chief authority on the subject of which it treats, and is a work of great value. In close connection with it, A. wrote his *Indian History*, giving an account of the people of India. Other writings by A., his letter to Hadrian on *A Voyage round the Coasts of the Euxine Sea*, and another, *A Voyage round the Coasts of the Red Sea*, are valuable with regard to ancient geography. There is still another work by our author—a treatise on the chase (*Kynegeticos*)—in which, as well as in the *Anabasis*, he has imitated Xenophon.

A. was one of the best writers of his day. His works bear the marks of care, honesty, and correctness; and they were numerous, though several have not been handed down to our time. All that we are possessed of appear to have had translations into Latin. There is a good French translation of the *Anabasis* by Chaussard, with commentary, 3 vols. (1802), and also a good one of the *Lectures of Epictetus* by Thurot (1838). The best critical edition of A. is that by Müller (Paris, 1846).

**ARRIAZA**, JUAN BAUTISTA, 1770–1837; a Spanish writer and politician. He was secretary to the embassy in London, where he published a poem on the influence of the

fine arts. In Spain he was an active monarchist, and occupied an important post in the bureau of foreign affairs. His *Patriotic Poems* were published in 1810.

ARRINGTON, ALFRED W., 1810-67; b. N. C.; in early life a noted Methodist preacher in North Carolina, his native state. He entered the law in 1834, and was a district judge in Texas in 1850. He removed to Chicago in 1857.

ARROBA, a weight commonly used in Spain, Portugal, Brazil, and in the principal Spanish and Portuguese colonies. In the first of these countries, it is equivalent to the English quarter of a cwt., or 28 lbs.; it is nearly the same in Portugal, etc. In Spain, the A. is also a measure for wine, brandy, etc., and contains four of our quarts.

ARRONDISSEMENT (from the French *arrondir*, to make round), the subdivision of a French department (q.v.).

ARROW. See BOW AND ARROW.

ARROWHEAD, *Sagittaria*, a genus of plants of the natural order *Alismaceæ*, distinguished by unisexual flowers, having three herbaceous sepals and three colored petals, numerous stamens, and numerous carpels, which are compressed, one-seeded, and on a globose receptacle. They are aquatic plants, natives of very different climates, from the tropics to the cold regions of the world.—The COMMON A. (*S. sagittifolia*) is a beautiful aquatic, a native of England, with arrow-shaped leaves which rise above the surface of the water. It is one of those plants which have enjoyed an undeserved reputation as cures for hydrophobia. The corms (or solid bulbs), dried and powdered, have sometimes been used for food, but have an acrid unpleasant taste.—The CHINESE A. (*S. sinensis*) is a native of China, and has long been cultivated in that country and Japan for its eatable corms, which, in a fresh state, are somewhat acrid, but abound in starch. It has arrow-shaped acute leaves, and a branched polygonal scape (leafless stem). It is grown in ditches and ponds. It is one of the plants sometimes cultivated in tanks in the hot-houses of Britain.

ARROW-HEADED CHARACTERS. See CUNEIFORM.

ARROW-HEADS. See ELF-ARROW-HEADS.

ARROW-ROOT is a variety of starch extracted from the roots of certain plants growing in tropical countries. It is a fine starchy farina, much valued as a delicacy, and as an easily digestible food for children and invalids. It is obtained from the tuberous roots—or more correctly, the root-stocks (*rhizomes*)—of different species of the genus *maranta*, belonging to the natural order *marantaceæ*, and characterized by solitary ovules, a fleshy style curved downwards, branching stems, and white flowers. The species chiefly yielding it is *M. arundinacea*, a native of tropical America, cultivated in the West India islands, and growing about 2 ft. high, with ovato-lanceolate somewhat hairy leaves, clusters of small flowers on 2-flowered stalks, and globular fruit about the size of currants. The roots (or rhizomes) contain a large proportion of farina. They are often more than a foot long, of the thickness of a finger, jointed, and almost white, covered with pretty large paper-like scales. They sometimes curve so that the points rise out of the earth, and form new plants. They are dug up when a year old, washed, carefully peeled, and reduced to a milky pulp. Mills for this purpose have been introduced, but in Jamaica the roots are usually reduced by beating in deep wooden mortars; in Bermuda by means of a wheel-rasp. The pulp is then mixed with much water, cleared of fibers, by means of a sieve of coarse cloth or hair, and the starch is allowed to settle to the bottom. The water dissolves, and so removes the greater part of the albumen and salts, the starch quickly settling down as an insoluble powder. Successive washings are employed for further purification. The A. is finally dried in the sun or in drying-houses, great care being taken, by means of gauze, to exclude dust and insects. The careful peeling of the roots is of great importance, as the skin contains a resinous matter, which imparts a disagreeable flavor to A. with which it is allowed to mix. Great care is taken to preserve the A. from impurities; and the knives used in peeling the roots, and the shovels used in lifting the A., are made of German silver. The West Indian A., most esteemed in the market, is grown in Bermuda; the next, and almost equal to it, in Jamaica. The East Indian A. is not in general so highly valued, perhaps because substitutes for the genuine A. more frequently receive that name. The *maranta arundinacea* is now, however, cultivated to some extent both in the East Indies and in Africa. *M. indica*, which was supposed to be distinct from *M. arundinacea*, is now regarded as a mere variety of it, with perfectly smooth leaves. It is cultivated both in the East Indies and in Jamaica. A. is obtained also from *M. allouya* and *M. nobilis* in the West Indies, and from *M. ramosissima* in the East.

The amount of fecula or starch present in the roots of the *maranta* varies according to age, and runs from 8 per cent, in those of the young plant, to 26 per cent when full grown. The latter stage is reached when the plant is 10 to 12 months old; and the roots then present the following composition in 100 parts:

Starch, fecula, or arrow-root.....	26
Woody fiber.....	6
Albumen.....	1½
Gummy extract, volatile oil, and salts.....	1
Water.....	65½

A. is exported in tin cases, barrels, or boxes, carefully closed up. It is a light, opaque, white powder, which, when rubbed between the fingers, produces a slight crackling noise, like that heard when newly fallen snow is being made into a snow-ball. Through the microscope, the particles are seen to be convex, more or less elliptical, sometimes obscurely triangular, and not very different in size. The dry farina is quite inodorous, but when dissolved in boiling water it has a slight peculiar smell, and swells up into a very perfect jelly. Potato-starch, with which it is often adulterated, may be distinguished by the greater size of its particles, their coarser and more distinct rings, and their more glistening appearance. Refined sago-flour is used for adulteration, many of the particles of which have a truncated extremity, and their surface is irregular or tuberculated. A. is also sometimes adulterated with rice-starch and with the common starch of wheat-flour.

Not less than 800,000 lbs. of A. are annually imported into the British isles. As an article of diet, it is often prepared for invalids and children by merely dissolving it in boiling-water and flavoring with sugar, lemon-juice, wine, etc. It is also often prepared with milk, made into puddings, etc. When most simply prepared, it forms a light meal, which, however, is not very nutritious. See NUTRITION.

A farina somewhat similar to A., and partly known by the distinct name of *tous-les-mois*, is obtained from some species of the allied genus *canina* (q.v.). But East Indian A. is in part obtained from the tubers of *curcuma angustifolia*. Other species of *curcuma* (see TURMERIC), as *C. zerumbet*, *C. leucorhiza*, and *C. rubescens*, also yield a similar farina; the same tubers which, when young, yield a beautiful and pure starch, yielding turmeric when old. In Travancore, this starch is a principal part of the food of the inhabitants. The young tubers of the galangal (q.v.), (*alpinia galanga*), another plant of the same natural order (*scitamineæ*), are another source of this farina.—A farina somewhat resembling A., and often sold under that name, is obtained from different species of the natural order *cyceadaceæ*, as from the dwarf fleshy trunks of *zamia tenuis*, *Z. furfuracea*, and *Z. pumila* in the West Indies, and from the large seeds of *dion edule* in the lowlands of Mexico.—The starch of the cassava, manihot or manioc (see MANIOC), is sometimes imported into Europe under the name of Brazilian A. Potato-starch, carefully prepared, is sometimes sold as English A.; and the farina obtained from the roots of the *arum maculatum* (see ARUM), as Portland A. Otaheite A. is the starch of *tacca* (q.v.) *pinnatifida*.—All these, as well as Oswego and Chicago corn-flour—the starch of maize or Indian corn—are so nearly allied to true A. as not to be certainly distinguishable by chemical tests; but the forms of the granules differ, so that they can be distinguished by the microscope.

The name A. is commonly said to have had its origin from the use of the fresh roots by the South American Indians as an application to wounds to counteract the effects of poisoned arrows; and the expressed juice has been recently recommended as an antidote to poisons, and a cure for the stings and bites of venomous insects and reptiles. But it is not improbable that the name is really another form of *ara*, the Indian name.

ARROWSMITH, the name of a family of English geographers. AARON, b. about 1750, in Durham, earned fame by his large chart of the world on Mercator's projection, and another on the globular projection. He d. in 1823, leaving two sons, AARON and SAMUEL; the former compiled the *Eton Comparative Atlas*, a biblical atlas, and geographical manuals. John A., nephew of the elder Aaron, published his *London Atlas* in 1834, following it with many other elaborate works in cartography. He was one of the founders of the royal geographical society. He d. May 2, 1873.

ARROYO MOLINOS, a village in Estremadura, Spain, noted as the scene of gen. Girard's complete discomfiture by lord Hill on the 28th Oct., 1811. Gen. Girard had been sent out by Soult on a plundering foray with 5000 men, when he was surprised early in the morning by lord Hill, who had slept a league off at Alcuescar; the natives of which had the good sense not to betray the presence of their deliverers. With a couple of regiments, the 71st and 92d, the English general dashed through the rain upon the enemy, who fled in all directions, leaving behind everything, arms, packs, etc. 1300 prisoners were taken; the whole artillery, colors, baggage, etc. French historians (Thiers, etc.), however, maintain that the battle was "undecided," and that their countrymen only retreated in good order, under the pressure of much larger forces.

ARRU' ISLANDS, a Dutch possession, s. of New Guinea, between 5° and 7° s. lat., and 134° and 135° e. long.; area, 1365 sq.m.; pop. 13,819, of whom 800 are Christians, 180 Mohammedans, the remainder heathens. Principal islands are Meykor, Wammer, Udjier, Wokkam, and Babi. Dobo on Wammer is the chief mart. Sago and cocoa-nut palms are plentiful, and some tobacco, rice, sugar-cane, maize, and edible roots, etc., are cultivated. The forests yield timber, and the sea, fish. The rocks give edible nests, and the woods shelter wild swine, hares, parrots, pigeons, birds of paradise, etc. Cotton goods, iron and copper wares, Chinese pottery, beads, knives, rum, and arrack are imported, and bartered for mother-of-pearl, trepang, edible nests, pearls, tortoise-shell, birds of paradise, etc.

ARSA'CES, a name common to several Parthian and Armenian kings. The accounts concerning them which have been transmitted to us by the ancient historians are exceedingly vague, confused, and contradictory; and modern criticism has found itself unable

to reconcile or simplify the conflicting statements. The most important members of the dynasty of the Scythian Arsacidae were A. I. and A. VI.

ARSACES I., the founder of the Parthian monarchy, flourished in the 3d c. b.c., under the reign of Antiochus-Theus. An atrocious insult offered to his brother Tiridates by Pherecles or Agathocles, Macedonian satrap of the country, is said to have fired his spirit, and driven him to rebel. The Macedonians were expelled, 256 b.c. Antiochus, embroiled in a war with Egypt, could not immediately find time to attempt the recovery of this portion of his dominions. Seleucus, the son of Antiochus, made two unsuccessful expeditions against the insurgent chief, in the last of which he was taken prisoner. A. I. now acquired regal power, built a city called Dara, on the mountain Zapaortenon, developed the internal resources of his new kingdom, and endeavored to organize it; and, after the conquest of several countries, d. at a great age. Such, at least, is the account given by Posidonius, etc.; but Arrian states that A. d. after a reign of two years, and that his brother Tiridates succeeded him, under the name of A. II., and ruled for thirty-seven years, whence we may conclude that many of the acts attributed to the founder of the Parthian kingdom were the work of his successor.

ARSACES VI., or MITHRIDATES I., flourished about the middle of the 2d c. b.c. He enlarged the territories of the Parthians by the conquest of Bactria; and is even supposed to have penetrated into India, and subdued the nations between the Hydaspus and Indus. In the year 133 b.c., he defeated and took prisoner Demetrius Nicator, king of Syria, whom, however, he treated generously, bestowing on him his daughter in marriage. He was a just and merciful prince, and an enemy to luxury.

ARSAMASS', or ARZAMAS, a t. in Russia, at the confluence of the Arsha and Teska, affluents of the Volga; pop. '67, 10,517. It is a manufacturing place, and has annual fairs. A. has 34 churches and 3 monasteries.

ARSENAL is the name given to a great military or naval repository, where the munitions of war are to some extent manufactured, but more particularly stored until required for use. Every royal dockyard, every magazine, every armory, is to some extent an A.; and therefore the meaning of the word is not quite definite. In France, the chief arsenals are at Cherbourg, Brest, and Toulon. In England, although Deptford is a considerable storehouse for naval clothing and provisions, and Weedon and the Tower great repositories for military stores, the only establishment vast enough to deserve the name of A. is at Woolwich. This is truly a remarkable and important place. In the spring of 1859, when war was raging in Italy between the French and Sardinians on one side, and the Austrians on the other, and when an uneasy feeling pervaded our own country, there were for a short time more than 10,000 men employed in Woolwich A. There were at that time nearly 12,000 pieces of iron ordnance in store, of which 7000 were of modern make and of heavy calibre. This store was supplementary to that which is always kept at the dockyards of Woolwich, Chatham, Sheerness, Portsmouth, Plymouth, and Pembroke. There were resources at the A. for bringing forward, fitting, and issuing these reserve guns at the rate of 200 per week, or double this number on an emergency; and many hundreds were within a brief period shipped thence, to strengthen our forts in the Mediterranean, in the colonies, and around the coasts. All the shot and shell used down to the period of the Crimean war, were ordered of private makers; but the charge was so enormous during the early months of that war, that the government resolved to try the manufacture at Woolwich; this was done, with a very manifest saving of expense. It has been calculated that the A., when at full work, could produce large shot and shell with six times the rapidity with which those missiles were used by the British outside Sebastopol during the eleven months' siege. These observations do not apply to rifles or muskets; none of these weapons are made at Woolwich. There have been times, however, during the year 1859, when nearly a *hundred million* rifle-bullets were in store at the A. The A. is divided into two great sections, of which the one is the depot for the storage of arms and all military equipments, whether for land or naval service; the other being occupied by the manufacturing departments. The latter comprise the gun factories, where all cannon are made; the carriage department, for gun-carriages and all means of transport; and the laboratory, whence come all cartridges, shot, shell, bullets, and warlike weapons.

ARSENAL (*ante*). In the United States, armories and arsenals were not established until after the revolutionary war; but powder was manufactured in Virginia in 1776. Gen. Washington chose Springfield, Mass., in 1777, as a suitable location for an A., and small arms were manufactured before 1787; an A. was also built in Carlisle, Pa., about the same time. The erection of an armory was begun at Harper's ferry in 1795, and congress ordered three or four more to be built in the same year, still more in 1808, and again after the war of 1812. Congress adopted the plan of having an A. in each state. In 1847 the United States had 2 armories and 17 arsenals; in 1860, 23 in all, 9 of which were enlarged during our civil war, the Springfield armory alone having capacity to complete 1000 muskets per day. The late gen. Rodman, in connection with the ordnance department, made great improvements in the art of casting cannon cooled from within, and the introduction of mammoth grain powder for use in large guns is due to him. Recently it has been decided to concentrate all manufacture of arms in three or four places, where all the regular operations are to be carried on. Rock island A., on the

Mississippi, is being built on this principle, and will include, when completed, an A., an armory, powder-works, and a foundry for large guns.

**ARSENIC** is the name applied in popular language to a well-known poisonous substance, arsenious acid (q.v.), but, strictly speaking, the term is restricted to the metal, of which the symbol is As and the equivalent is 75.0. The metal A. is rarely found free in nature, but in a state of combination it occurs largely (see ARSENICAL MINERALS). The metal is generally prepared from arsenious acid ( $\text{AsO}_3$ ) by mixing it with its own weight of charcoal, placing the mixture in a well-covered crucible, and subjecting the whole to heat, when the metal set free by the charcoal rises, and condenses in the upper part or cover of the crucible. Metallic A. is very brittle, can easily be reduced to powder by hammering, or even pounding in a mortar; and when a freshly-cut surface is examined, it presents a brilliant dark steel-gray lustre, which, however, readily tarnishes on exposure to the air. The metal, as such, is not considered poisonous, but when introduced into the animal system, it is there faintly acted upon by the juices, and in part dissolved, at the same time exhibiting poisonous properties. When heated in the open air, it burns with a peculiar bluish flame, and emits a characteristic alliaceous odor. The only use to which the metal A. is applied in the arts is in the manufacture of leaden shot of the various sizes, when its presence in small quantity in the lead renders the latter much more brittle than it ordinarily is. Of all the compounds of A. the most important is the one already alluded to—viz., arsenious acid, which is an oxide of A. With sulphur, A. forms two important compounds: *realgar* ( $\text{AsS}_2$ ), a red, transparent, and brittle substance, which is employed in the manufacture of the signal-light called *white Indian fire*; and *orpiment* ( $\text{AsS}_3$ ) or *king's yellow*, a cheap pigment of a yellow color. With hydrogen, A. forms arseniuretted hydrogen ( $\text{AsH}_3$ ), a very poisonous gas, and one which has been fatal to several chemists.

**ARSENICAL MINERALS** occur chiefly in primitive rocks, and frequently associated with other metalliferous minerals.—*Native arsenic*, although nowhere very abundant, is not unfrequently found in mines in Europe, Asia, and America, generally along with sulphur and metallic sulphurets. In Britain, it occurs at Tyndrum in Perthshire. It has usually a fine granular character. It is very seldom, if ever, quite pure, usually containing a little antimony and iron, and not unfrequently a very little silver or gold.—A very similar, and still rarer mineral, found in similar situations, is known as *arsenic-antimony*, and consists of about two parts of metallic arsenic, and one of metallic antimony.—*Arsenic-silver*, or *arsenical silver*, is another very rare mineral, consisting chiefly of arsenic and iron, but containing also about 13 per cent of silver and a little antimony.—*Arsenic-glance*, found at Marienberg in Saxony, and containing about 3 per cent of bismuth, has the remarkable property of taking fire at the flame of a candle.—*Arsenious acid* occurs native in a few localities in Germany and France, and as a mineral species, has received the name of *arsenite*, which perhaps too closely resembles the chemical designation of its salts.—*Arsenic acid*, another compound of arsenic and oxygen ( $\text{AsO}_3$ ), containing more oxygen than arsenious acid, although it does not itself occur native, is not unfrequent in the form of compounds with copper and lead (*arsenates* of copper and lead), which enter into the composition of a number of minerals, none of them so abundant as to be of any importance.—Among A. M. are also to be ranked the compounds of arsenic with sulphur, particularly *orpiment* (q.v.), *realgar* (q.v.), and *dimorphine*, a rarer mineral than the other two, and therefore less important.—But the most important of all A. M., because of their use as ores of arsenic, for the preparation of white arsenic, or arsenious acid, are those in which arsenic is combined with nickel and cobalt. One of these is *arsenical pyrites*, or *leucopyrite*, found in various mines of the continent of Europe, and containing arsenic, iron, sulphur, nickel, and cobalt, in somewhat various proportions—the arsenic, however, always the principal constituent. It generally occurs massive.—*Mispickel*, which frequently occurs in rhombic crystals, but often also massive, differs from it in containing a considerable quantity of silver, so that it is used both as an ore of arsenic and of silver. It is found in many of the tin-mines of Cornwall, and is pretty frequent in different parts of the world.—*Nickeline* consists of nickel and arsenic, and is used as an ore of nickel, and also for the preparation of white arsenic.—*Cobaltine* and *smaltine*—the former consisting of cobalt, sulphur, and arsenic; the latter, of cobalt and arsenic—are used for the preparation of blue colors for porcelain and stoneware. Both are found in Cornwall; they occur also in some of the mines of the continent of Europe, and in other parts of the world.—The presence of arsenic in a mineral may commonly be detected by the alliaceous odor which it emits before the blowpipe.

**ARSENIOUS ACID** is the arsenical compound most familiarly known. It is obtained principally during the roasting of the arsenical nickel ores in Germany in furnaces communicating with flues. When the arsenic of the ore burns, it passes into the condition of A. A. ( $\text{AsO}_3$ ), and rising as vapor into the somewhat cool flue, is there deposited as a grayish powder, known by the names of *smelting-house smoke*, *flowers of arsenic*, *poison-flour*, or *rough A. A.* In this condition, the A. A. is contaminated with some impurities, from which it may be separated by introducing the gray powder into an egg-shaped vessel, and applying heat at the lower end, when the A. A. rises in vapor, and condenses in the cool end as a transparent glassy or vitreous substance. Ordinary A. A. of the

shops (which is what is popularly known as *arsenic*) is a white crystalline powder, which feels decidedly gritty, like fine sand, when placed between the teeth, and has no well-marked taste. It is very heavy, so much so as at once to be noticeable when a paper or bottle containing it is lifted by the hand. It is soluble in water to the extent of 1 part of A. A. in about 100 parts of cold water, and 1 part of A. A. in about 10 parts of boiling water. As ordinarily sold in quantities under 10 lbs. in weight, the A. A. is required by law to be colored with  $\frac{1}{100}$  of its weight of indigo, or  $\frac{1}{10}$  of its weight of soot; the object of the admixture being to render any liquid to which the A. A. might be added, with a murderous intent, of a black or bluish-black hue, and thus indicate the presence of something unusual. In packages of 10 lbs. and upwards, A. A. is allowed to be sold in the pure white crystalline form without coloration. When placed in a spoon, or other vessel, and heated, the A. A. volatilizes, and condenses in crystals on any cool vessel held above. By this means, it can be distinguished from ordinary flour, which, when heated, would char, and leave a coal behind; and from chalk, stucco, baking-soda, tooth-powder, and other white substances, which, when heated, remain in the vessel as a non-volatile white residue. Again, when A. A. is placed on a red-hot cinder, and the escaping vapors cautiously brought under the nostrils, the strong alliaceous odor characteristic of arsenic is given off. The mode in which A. A. comports itself, when thrown upon water, is likewise peculiar. Instead of at once descending through the water like sand, the A. A., notwithstanding its great density (sp. gr. 3.70), partially floats on the surface, as wheat-flour does; and that portion which sinks in the water, rolls itself into little round pellets, which are wetted only on the outside, and contain much dry A. A. within. The solution of A. A. in water is recognized by three tests:

1. Hydrosulphuric acid and hydrochloric acid produce a *yellow precipitate* of sulphuret of arsenic ( $\text{AsS}_3$ ), soluble in ammonia.

2. Ammonio-sulphate of copper, an *apple-green precipitate* of arsenite of copper ( $2\text{CuO}, \text{AsO}_3$ ).

3. Ammonio-nitrate of silver, a *yellow precipitate* of arsenite of silver ( $2\text{AgO}, \text{AsO}_3$ ).

In many cases A. A. is used as a means of destroying animal life, but happily, the processes for the detection of the poison in organic mixtures and in the animal tissues are so unerring and trustworthy, that it is hardly within the range of possibility that an animal can be destroyed by the administration of A. A. without very decided evidence of the existence of the poison being obtained on examination of the various parts of the animal structure; indeed, it may be safely said that there is no limit to the detection of the poison, as even after the animal structure has been so far decomposed that little remains, yet still the poison, from its indestructibility, survives, and will indicate itself clearly, on the application of the several tests.

For the isolation and recognition of A. A. in organic mixtures, such as the contents of a stomach, three processes may be followed. The method generally pursued, and that upon which greatest dependence is placed, is called Reinsch's process, from the name of its discoverer. The manner of its application is to treat the organic mixture with water sufficient to render it thin, then add hydrochloric acid to the extent of one eighth of the volume of the liquid; apply heat, and when the whole has been raised to near the boiling-point, introduce clean, newly burnished pieces of copper in the form of wire, gauze, or foil. If A. A. be present in the mixture, a steel-gray coating of metallic arsenic will form on the surface of the copper. This apparent tarnishing of the copper may take place when no A. A. is in the mixture, and may be produced by salts of mercury, antimony, etc., as well as by sulphur compounds, and even occasionally by fatty matters. To distinguish between the coating formed by A. A. and that produced by other substances, the copper is taken out of the mixture, washed with water, to remove acid; immersed in ether, to dissolve off any adherent fatty matter; dried between folds of blotting-paper; introduced into the lower end of a dry glass test-tube, and there cautiously heated. The metallic arsenic (As) is driven off by the heat from the surface of the copper, rises in vapor into the upper portions of the test-tube; there meets the oxygen of the air, with which it combines, forming A. A. ( $\text{AsO}_3$ ), and thereafter deposits itself on the inner surface of the cool part of the tube in little glistening crystals. On allowing the tube to cool, adding water thereto, and applying heat, the water dissolves the crystals of A. A., yielding a solution, to separate portions of which the liquid tests mentioned above may be successfully applied. This process may likewise be employed in the detection of A. A. in animal tissue, as in the liver, spleen, kidneys, etc., by first dividing the animal matter into small pieces, and thereafter treating with water, hydrochloric acid, and copper. The precautions which require to be exercised in trying this process are, that the hydrochloric acid and copper are themselves free from A. A. Hydrochloric acid has long been known to be liable to contain at times a very sensible proportion of the poison, and it is therefore necessary, before using the acid in any experiment, to make a preliminary trial with dilute hydrochloric acid, into which, when heated, a piece of copper is immersed; and if no tarnishing occurs after a quarter of an hour's trial, the acid may be declared free from contamination with arsenical compounds. The liability of copper to contain arsenic some years ago (Aug., 1859) assumed importance in connection with a trial for murder by slow poisoning with arsenic, which took place in Britain. In this case, a considerable amount of copper was dissolved during the testing, and supplied the

poison in quantity enough to produce a faint coating on a piece of copper which was subsequently introduced into the liquid. The result was that A. A. was at first declared to be present in the material under examination; but further experiments demonstrated that the copper itself had afforded the arsenic. To free copper from any arsenic which it may contain originally, it is only necessary to heat the copper over a gas or spirit-lamp flame, when the arsenic volatilizes, and leaves the copper uncontaminated therewith.

The other two processes for the detection of A. A. in organic mixtures are—1. That recommended by Marsh, in which the material is treated with dilute sulphuric acid and metallic zinc in a gas-generating apparatus, when the arsenic combining with hydrogen, forms arseniuretted hydrogen ( $AsH_3$ ), from which, in the act of escaping, the metallic arsenic, and subsequently A. A., can be obtained; and 2. That known as Berzelius's process, in which dry arsenical compounds are mixed with the reducing flux, and heated in a constricted tube, when the metal arsenic is produced, which in its turn is converted into A. A. by heating in a wide test-tube. The processes of Marsh and Berzelius are not so generally followed as that of Reinsch; but in each and all it is absolutely necessary, in order to avoid the possibility of mistake, (1) that metallic arsenic be obtained from the organic mixture; (2) that the metallic arsenic be converted into A. A.; and (3) that this A. A., treated with water, should yield a solution which will give the three liquid tests mentioned previously.

A. A. forms compounds (salts) with alkalies and other bases, which are called arsenites. Some of these are employed in commerce and medicine. A. A., boiled with solution of potash, or carbonate of potash, forms an arsenite of potash, used in medicine, and known as *Fowler's solution*. The more largely used sheep-dipping mixtures are composed of A. A., soda, sulphur, and soap, which, when used, are dissolved in a large quantity of water, and thus constitute essentially dilute solutions of arsenite of soda. A compound of A. A. and the oxide of copper, called the arsenite of copper, or *Scheele's green*, is a pigment largely used by painters as a pretty and cheap green paint. The same substance is extensively employed in the manufacture of common green paper-hangings for the walls of rooms, and recent inquiries would lead to the belief that rooms covered with paper coated with this green arsenite of copper, are detrimental to the health of human beings residing therein, from the readiness with which minute particles of the poisonous pigment are detached from the walls by the slightest friction, are diffused through the room, and ultimately pass into the animal system. Another green pigment is named *Schweinfurth green*, and contains A. A., oxide of copper, and acetic acid, and is a double arsenite and acetate of copper.

**ARSENIC (ARSENIOUS ACID), Properties of, as a Drug.**—A. has long been used as a medicine. When taken into the stomach, it is soon absorbed into the blood, and circulates with that fluid, exhibiting great power over certain diseases, especially skin diseases, as psoriasis, lepra, eczema (q.v.), etc. It is also classed among the tonic minerals, and given for nervous disorders, especially those that are periodic. Of late it has been much recommended for rheumatism; and Dr. Begbie, of Edinburgh, considered that among the remedies for chorea (St. Vitus' dance) it holds the foremost place. In ague, also, and remittent fever, as well as in other disorders originating from the same source, A. and quinine are our chief remedies. They are considered to act as alteratives of the blood. The usual method of administering A. is in small doses (from 3 to 5 drops) of the liquor arsenicalis, largely diluted with water, twice or thrice in the day. Arsenic is sometimes given combined with iodine and mercury (Donovan's solution).

When given in the doses above mentioned, for 8 or 10 days, symptoms of poisoning begin to appear; the skin becomes hot, the pulse quick, the eyelids hot and itchy; the tongue has a silvery appearance; the throat is dry and sore, the gums swollen and tender; and if the treatment is persisted in, salivation ensues, and then come nausea, vomiting, diarrhoea, nervous depression, and faintness (Begbie). The quantity necessary to destroy life, of course, varies. Dr. Christison records the case of a man who died in six days, after taking 30 grains of the powdered white A.; but a much smaller dose will prove fatal; a girl was killed with  $2\frac{1}{2}$  grains of A. contained in 2 ozs. of fly-water. According to Dr. Swaine Taylor, a medical witness is justified in stating, that under circumstances favorable for its operation the fatal dose for an adult is from *two to three grains*. Death from a poisonous dose of A. may occur in a few hours, or after the lapse of days. A woman, aged 56, used a solution of A. in water to cure the itch; she experienced severe suffering, and died after two years, having had symptoms of arsenical poisoning all that time.

A. has been used frequently as a slow poison, the symptoms being attributed to inflammation of the bowels from natural causes. Fortunately, in most cases its detection is easy. Orfila found A. in the soil of cemeteries, a fact which has created some discussion among toxicologists. A. is used by anatomists as an antiseptic, but is dangerous, as it is apt to get into cuts on the hands, and under the finger-nails, and cause disagreeable symptoms. It is stated that in some countries, especially in Styria, A. is taken by the young female peasants to increase their personal attractions; a statement which probably amounts to this, that experience of its tonic and other qualities induces some individuals to prescribe for themselves a medicine which ought only to be administered by a skillful and cautious hand. That A. can be taken habitually for any length of time, would seem a physiological impossibility; and yet such statements are made on what

appears to be unquestionable authority. See *Chambers's Journal*, vol. v. p. 90, and vi. p. 46; also Johnston's *Chemistry of Common Life*.

No effective chemical *antidote* for A. has yet been discovered. In case of an overdose, or of intentional poisoning, the following treatment is recommended: Evacuate the stomach by the stomach-pump, using lime-water; administer large draughts of tepid sugar and water, chalk and water, or lime-water; avoid the use of alkalies, but administer charcoal and hydrated sesquioxide of iron; bleed freely; take a tepid bath, and use narcotics. If the fatal symptoms be averted, let the patient for a long time subsist wholly on farinaceous food, milk, and demulcents.

**ARSIN'OE**, the daughter of Ptolemy I., king of Egypt, and of Berenice, was b. about 816 B.C., and married in her 16th year to the aged Lysimachus, king of Thrace, whose eldest son, Agathocles, had already wedded Lysandra, the half-sister of A. Desirous of securing the throne to her own children, A. prevailed on her husband to put Agathocles to death; the consequences of which crime, however, were fatal to the Thracian monarch; for Lysandra, having fled with her children to Seleucus in Asia, managed to induce him to declare war against her unnatural father-in-law. Lysimachus was slain, and Seleucus seized the kingdom. A. now sought refuge in Macedonia, which, however, was also taken possession of by Seleucus; but on the assassination of the latter, after a few months, by Ptolemy Ceraunus, the half-brother of A., she received a hypocritical offer of marriage from Ptolemy, who wanted to destroy her two sons, lest they should prove formidable rivals to his ambition. She consented to the union, and opened the gates of the town in which she had taken refuge, but her children were butchered before her eyes. She then fled to Egypt (379 B.C.), where she married her own brother, Ptolemy II. Philadelphus. These unnatural unions subsequently became common among the Greek kings of Egypt. It does not appear that A. had any children by her brother, though she was regarded by him with the deepest affection. He named several cities, and also an entire district, by her name. After her death, he ordered Dinochares, the architect, to build a temple to her memory, and roof the edifice with loadstones, so that her iron statue might seem to float in the air.

**ARSIN'OE**, daughter of Ptolemy Auletes, of Egypt. She escaped from Alexandria when that city was besieged by Cæsar, 47 B.C., and was received as queen by the Egyptians, her brother Ptolemy Dionysius being in Cæsar's hands. The city was taken, and A. was one of the captives led in triumph through the streets of Rome, where the people expressed great sympathy for her. She was liberated by Cæsar and returned to Egypt, but her sister Cleopatra persuaded Antony to have her put to death, 41 B.C., although she had taken refuge in the temple of Diana.

**ARSIN'OE**, a city on the w. bank of the Nile, near lake Mœris, s.w. of Memphis. It was called "the city of crocodiles," because of the reverence paid to that animal by its people; but Ptolemy Philadelphus named it A. in honor of his sister-wife. It was in the most fertile district of Egypt. Extensive mounds yet mark its site near the modern town of El Faium. In the later Roman days, A. became the seat of an episcopal see.

**ARSIN'OE**, a city near the n. extremity of the Red sea, not far from the present Suez. This was another of the towns to which Ptolemy Philadelphus gave the name of his queen, and all of its revenue was given to her. It was near the eastern terminus of the Nilotic canal, which Ptolemy carried from the Bitter lakes to the head of Heroöpolite bay, or the Red sea. The city was favorably situated for East India trade.

**AR'SIS AND THE'SIS** (Gr. raising up, and laying down), a term in music applied to the rising and falling of the hand in beating time. It is also applied to the elevation and depression of the voice in speaking.

**ARSON**, or, as it is called in Scotland, *willful fire-raising*, is, according to the laws of all civilized countries, a crime of the deepest atrocity; for it involves in its consequences not only destruction of property, but also the destruction of, or at least an indifference to, the life or lives of others, which can only be imputed to the most wicked and malignant spirit. In the criminal law of England, it is a felony, and has been described as the malicious and willful burning of the house or building of another man. It is essential to the offense that the house or building burned should be that of *another*; for although it is a misdemeanor to destroy one's own house by fire, especially in a town, or where other buildings are contiguous, which are thereby put in danger, such an offense does not amount to a felony, strictly so called. To constitute such felony, there must be an *actual* burning; for no intent, however clear, would suffice at common law to support a charge of A. This crime is the subject of express statute (the consolidation act, 24 and 25 Vict. c. 97), the provisions of which considerably modify and enlarge the doctrines of the common law on the subject. The chief of the enactments of this, the malicious injuries to property act, enacts that whoever shall unlawfully and maliciously set fire to any dwelling-house, any person being therein, shall be guilty of felony, and liable to penal servitude. Also that whoever shall unlawfully and maliciously set fire to any church or chapel; or to any chapel for the religious worship of persons dissenting from the United church of England and Ireland; or to any house, stable, coach-house, out-house, warehouse, office, shop, mill, malt-house, hop-oast, barn, or granary; or to any erection used in carrying on any trade or manufacture, or any branch thereof,

whether in possession of the offender or any other person—with intent, in the latter cases, to injure or defraud any person, shall be guilty of felony; and he is liable to penal servitude for life, or not less than three years, or to imprisonment not exceeding two years. Doubts having arisen on a former act, whether its provisions extended to the setting fire to a hovel or shed not appendant to any house, it was expressly provided, by the above act, that whoever should unlawfully and maliciously set fire to any hovel, shed, or fold; or to any farm-building; or any building or erection used in farming land—whether the same, or any of them respectively, shall then be in the possession of the offender, or the possession of any other person—with intent thereby to defraud any person, shall be guilty of felony, and he is liable to a like punishment. Moreover, that whoever shall unlawfully and maliciously set fire to any hay, straw, wood, or other vegetable produce, being in any farm-house or farm-building; or to any implement of husbandry, being in any farm-house or farm-building; with intent to set fire to such farm-house or farm-building, and to injure or defraud any person—shall be liable to the same punishment as for setting fire to the farm-house or farm-building itself; and every male so offending, under sixteen, shall be also liable, at the discretion of the court, in addition to any other sentence, to be whipped. Again, unlawfully and maliciously, by any overt act, to attempt to set fire to any building, stack, or steer, or vegetable produce, of such kind and with such intent that if the offense were complete, the offender would be guilty of felony, and liable to penal servitude for life (though such building, stack, steer, or vegetable produce be not actually set on fire), is deemed felony; and is punishable with penal servitude above three years; or imprisonment for two years, with the same addition in respect to whipping, if the offender be a male under sixteen. And lastly, if any person shall maliciously set fire to any station or other building belonging to any railway, dock, canal, or other navigation, he is guilty of felony; and he is liable to penal servitude for life, or any term not less than three years; or to be imprisoned, with or without hard labor, for any term not exceeding two years; and if any person maliciously set fire to any *goods or chattels* being in any building, the setting fire to which is made felony by act of parliament, he is guilty of felony; and he is liable to penal servitude for any term not exceeding fourteen years, nor less than three years, or to be imprisoned, with or without hard labor, for any term not exceeding two years.

Servants convicted of negligently setting fire to houses and buildings, shall, by 14 Geo. III. c. 78, s. 84, forfeit £100, to be distributed among the sufferers, by the church-wardens, in such proportions as to such church-wardens shall seem just; and in case of default, shall be committed to jail or the house of correction for 18 months, to be kept to hard labor.

It has been laid down in Scotland, that if the fire has been willfully kindled, it matters not how circuitous may have been the mode of operation selected, although the injury intended to have been done was not the actual burning of the house, but some inferior mischief. And it is the law of both countries, that if the proprietor of a house set fire to it while in possession of a tenant holding under a lease, the crime of *A.* is completed; and in Scotland, the same has been ruled where the house was occupied by a party having a life-interest in it.

By the 29 Geo. III. c. 46, an act which applies to Scotland as well as England, it is enacted, that if any person shall maliciously and unlawfully set fire to, or in any wise destroy, any ship or vessel, whether the same be complete or in an unfinished state, or shall maliciously and unlawfully set fire to, cast away, or in any wise destroy any ship or vessel, with intent thereby to prejudice any owner or part owner of such ship or vessel, or of any goods on board the same, or any person that hath underwritten, or shall underwrite any policy of insurance upon such ship or vessel, or on the freight thereof, or upon any goods on board the same; every such offender shall suffer death as a felon.\*

Both in England and Scotland, it is a considerable aggravation of the offense where the burning is to defraud insurers.

ARS-SUR-MOSELLE, a t. in Alsace-Lorraine, at the junction of the Mance and Moselle, 6 m. s.w. of Metz; pop. '71, 5330. During the Franco-German war it was a place of much strategic importance in connection with the siege of Metz. It has iron mines, forges, and paper-mills.

ART. The word *A.* is here meant as designating what is more specifically termed fine *A.*, being opposed to the useful arts, or the industrial operations for supplying the common necessities of life. Painting and poetry are fine arts; agriculture, navigation, and medicine are useful arts.

The great end of *A.* is to give pleasure, but the kind of pleasure is peculiar and circumscribed. There are many of our enjoyments that no artist would ever think of attempting to provide. The gratifications of eating and drinking, of exercise and repose, warmth and coolness, form a class in contrast with the pleasures of music, sculpture, or the drama. It is a matter of some nicety to draw the line between these two regions of our pleasurable susceptibility; indeed, it is not clear that a precise line can be

\* The statute 29 Geo. III. c. 46, has not been repealed, though there are similar enactments in the English malicious injuries to property act, but omitting the punishment of death.

drawn. Certain peculiarities can be assigned as disqualifying circumstances, such that any mode of pleasure laboring under them is debarred from entering into A.; but after we have allowed for these, there will remain a disputed border-land, on which no general criterion will hold.

The various indulgences called sensual are the best examples of contrast to the pleasures of A. In the first place, as our frame is constituted, these bodily functions, while incidentally ministering to our pleasure, are in the main subservient to maintaining our existence, and being in the first instance guided for that special end, they do not necessarily rank among our gratifications as such; in the second place, they are connected with the production of what is repulsive and loathsome, which mars their purity as sources of pleasure; and in the third place, they are essentially confined in their influence to the single individual; for the sociability of the table is an element superadded. Now, a mode of pleasure subject to one or more of these three conditions may belong in an eminent degree to the list of utilities, and constitute an end of industry, but does not come under the class we are now considering. Wealth is disqualified by the third condition, inasmuch as, while in the shape of money, it is confined to some single proprietor. The same may be said of the pleasures of power and dignity. Even affection is too exclusive to come under the artistic head. Anything so restricted in its sphere of action as to constitute individual property, and give occasion to envy and jealousy, is not a pleasure aimed at by the producer of fine A.; for there do exist objects that can give us delight as their primary end, that have no disagreeable or revolting accompaniments, and whose enjoyment is not restricted to a single mind; all which considerations obviously elevate the rank of such objects in the scale of our enjoyments. The landscape, the glowing sunset, the song of the lark, the flowers of the field and the garden, yield unalloyed pleasure, and create no monopoly. The painter, sculptor, and musician aim at corresponding effects.

The eye and the ear are the chief avenues of artistic delight; the other senses are more or less in the monopolist interest. Moreover, one important feature in the somewhat capricious attribute termed *refinement*, attaches more particularly to the objects of these two senses, namely, the power of protracted enjoyment without fatigue. A *coarse* effect is one that is intense and pungent, but too exhausting to be kept up; such is a noisy clash of loud instruments in a musical performance, or a tale of overdone marvels. To remove all the fatiguing accompaniments, and thereby tone down the exciting influence, while retaining as much as possible the really pleasurable part, is to refine upon the effect, and produce a higher work of art. Now, in the sensations of taste and smell generally, the stimulus is apt to be of short duration; the pleasure is said to pall soon. Yet there are degrees in the case, some of the choicer odors can affect us for hours together with a gentle and pleasing sensation. But it is the ear, and perhaps still more the eye, that can remain open to agreeable stimulation for the greatest length of time; and taking this fact along with the unconsuming nature of their objects, we see good reasons for the artist striving so earnestly towards the gratification of those two senses.

The sensual elements can be brought into A. by being contemplated in the *idea*, in place of being enjoyed in the reality. A painter or poet may depict a feast to our minds, and impart a pleasure that differs essentially from the delights of eating and drinking. The imagined repast has nothing to do with our bodily necessities; the disagreeable accompaniments can be kept out of view; and any number of persons may share in the effect. So with the elements of wealth, power, dignity, and affection, which in their actuality want the liberal character of the true artistic delight; if we can only derive pleasure from the spectacle of them in the hands of the select number of their possessors, they become to us an enjoyment that can be shared by the general multitude, like the blue sky, or the towering peak. It is the fact that mankind find a charm in contemplating the wealthy, the powerful, the elevated, the illustrious, the beloved; and accordingly such elements are freely adopted into artistic compositions.

If all the sensual gratifications could become artistic by being contemplated in *idea*, or merely thought of, as in the above case of imagining a rich feast, we should have the means of distinctly circumscribing the select region of the beautiful or artistic, and of resolving a difficult problem. It would be admissible for the poet or painter to suggest any of those inferior pleasures to the mind by descriptive touches, and he would thereby elevate them into the region of art. But we find that every mode of sensual gratification is not open to this ideal presentation. Even as regards eating and drinking, exception is taken against the too free allusion to those pleasures; while the sensuality of love is hardly to be suggested through the most distant allusion. We may revel in tales of mere tender emotion—of parental love and of pure affection—but those other subjects are kept at the utmost distance; and we should be said to be reveling in sensuality, if we were merely to indulge in the imagination of those species of delight. There is no help, therefore, but to consider that there are *conventional* and arbitrary limitations of the sphere of the artist, rendering it quite impossible to draw any clear and universal boundary-line between the beautiful and the agreeable generally.

Sublimity, beauty, grace, harmony, melody, pathos, ideality, picturesqueness, proportion, order, fitness, keeping, and the ludicrous, though they do not all relate to the so-called *beautiful*, are all involved in the circle of pleasures now before us; and it is quite obvious that no one fact can run through this variety of designations. There must

be a great multitude of agents operating to produce these different impressions, which are related to one another only by attacking in common to the æsthetic class of compositions. Doubtless, several of these names may be employed to mean the same thing, being, in fact, partially synonymous terms, as beauty and grace—proportion, fitness, and keeping; but hardly any two terms are synonymous throughout, and there are distinct conceptions implied in sublimity, beauty, picturesqueness, fitness, and the ludicrous.

Among the elementary sensations and emotions of the human mind that are of a pleasurable kind, a certain number may enter at once into the composition of A.; such are the pleasures of sound and sight, the emotion of surprise, and plot-interest. Others may enter by ideal presentation; as the gratifications of the remaining senses, and the emotions of fear, tenderness, irascibility, power. The feelings more specific to A. are those produced by harmony under its various aspects. When sweet sounds are harmoniously combined, we have the musical art; the painter has a similar aim in reference to colors and forms; and so through all the fine arts, this quality is found recurring as the crowning work of the artistic hand. Nothing is so indisputably included within the circle of the æsthetic or beautiful as finely struck harmonies, melodies, or concords. Whatever else may be included in a composition, it is the admission of these that gives the specific charm, although it would be a mistake to dispense with other elements of interest common to art and to every-day life. Story is essential to romance and poetry; sweetness in the separate sounds is requisite for good music; and color in itself imparts æsthetic pleasure apart from harmonious union.

The agreeable effect designated by fitness takes rank with the artistic pleasures; we may call it the æsthetic of the useful. When a work is not only done effectually, but done with the appearance of ease, or the total absence of restraint, difficulty, and pain, we experience a delight quite different from the satisfaction growing out of the end attained. Much of the pleasure of architectural support is referable to this source.

Among the susceptibilities touched by artistic arrangements may be noticed the sense of unity in multitude, arising when a great number of things are brought under a comprehensive design, as when a row of pillars is crowned by a pediment. The use of simple figures—the triangle, circle, square, etc.—for inclosing and arranging a host of individuals, has the tendency to make an easily apprehended whole out of a numerous host of particulars. In all large works abounding in detail, we crave for some such comprehensive plan, whereby we may retain the total, while surveying the parts. A building, an oratorio, a poem, a history, a dissertation, a speech, should have a discernible principle of order throughout; the discernment of which gives an artistic pleasure, even in works of pure utility.

The craving for variety and novelty is a powerful impulse of the human mind, and makes itself especially apparent in the appreciation of works of A. The greatest works cease to please after a time, and temporary fashion may occasionally lord it over the perennial in taste.

In looking at the fine arts individually, we may divide them into two classes, by drawing a distinction of some importance as regards the question of an artistic standard. The one class contains the *effusive* arts, or those which consist of mere outbursts of the inward spontaneity, regulated by the effect of the display on the sense of the beholder or listener. Music is a good example. The spontaneous effusions of the human voice, and those prompted by the various emotions, are corrected and tuned by the ear into melody and harmony, and after this process has been often repeated, pleasing airs and compositions are the result. It is the same with the dance, considered as a fine art. In like manner, dramatic gesture and display, and the graces of elocution and fine address, are the natural promptings rendered pleasing by being changed and modified for that express end. The first movements are mere random, but the delicate sensibility of the beholder causes some to be suppressed, and others brought out, until a really pleasing combination is attained. Contrasted with the purely effusive, are the so-called *imitative* arts, or those that involve the representation of some of the appearances of the outer world. Such are painting, sculpture, and poetry. In these, the artist, while still aiming at pleasing effects, is trammelled with a new condition—namely, a certain amount of fidelity to his original. In the others, there are no originals. The musician imitates nothing, and is bound by the sole condition of gratifying the ear; but a painter chooses his subject from nature, and although he must contrive to yield the pleasures of color, outline, and grouping, he must do so with a certain respect to the object copied. The poet, in depicting the life of men, comes under the rule of fidelity to this extent, that an obvious misrepresentation is apt to give a painful shock, and mar the pleasure that would otherwise be derived from the poetry itself. It is not so much that truth is a part of the artistic pleasure, as that falsehood is a stumbling-block in the way; for even the imitative arts are only so in part. There is no imitation in the meter and cadence of a song, and yet these often constitute the main charm. So a certain license of fantastic effusion is allowed to poets, subject to no rules but the giving of pleasure. The creation of imaginary worlds, when avowed, is not objected to; and the criterion of fidelity to the actual is accordingly laid aside for the time. The various arts of decoration and design are for the most part effusive, although occasionally imitative. Architecture is not in any way imitative; the coincidence between the Gothic roof and the intermingling foliage of a double row of trees is a mere accident.

These observations are necessary in order to qualify the current maxim that nature is the artist's standard, and truth his chief end; conditions that, in their strictness, apply only to science. It is the scientific man that should never deviate from nature, and should care for truth above every other consideration. The artist's standard is *feeling*, his end is refined pleasure; he may go to nature, but it is to select what chimes in with his feelings of artistic effect, and pass by the rest. He is not bound to adhere to nature even in her choicest displays; his own taste being the touchstone, he alters the originals at his will. The student of science, on the other hand, must embrace every fact with open arms. If a nauseous fungus or loathsome rat meet the eye of a naturalist, he is bound to record it as faithfully and minutely as he would dilate on the violet or the nightingale. When a painter adopts the human figure as a basis for setting forth harmonies of color, beauties, and form, and picturesqueness of grouping, he ought not to jar our sense of consistency by a wide departure from the usual proportions of humanity. Still, we do not look for anatomical exactness; we know that the studies of an artist do not imply the knowledge of a professor of anatomy; but we expect the main features of the reality to be adhered to. In like manner, a poet is not great because he exhibits human nature with literal fidelity; to do that makes the reputation of a historian or mental philosopher. The poet works by his meters, his cadences, his touching similes, his graceful narrative, and his exaltation of reality into the region of ideality; and if in all this he avoids serious mistakes and gross exaggerations, he succeeds in his real vocation.

The attempt to reconcile the artistic with the true—art with nature—has given birth to a peculiar school, in whose productions a restraint is put upon the flights of pure imagination, and which claims the merit of informing the mind as to the realities of the world, while gratifying the various emotions of taste. Instead of the tales of Fairyland, the Arabian Nights, and the Romances of Chivalry, we have the modern novelist, with his pictures of living men and manners. In painting, we have natural scenery, buildings, men, and animals represented with scrupulous exactness. The sculptor and the painter exercise the vocation of producing portraits that shall hand down to future ages the precise lineaments of the men and women of their generation; hence, the study of nature has become an element in artistic education; and the artist often speaks as if the exhibition of truth were his leading purpose. It is probably this endeavor to subject the imagination more strictly to the conditions of truth and reality, that has caused the singular inversion whereby the definition of science is made the definition of art.

But while fidelity, in the imitative class of arts, is to be looked upon, in the first instance, as avoiding a stumbling-block rather than constituting a charm, there are still certain ways wherein we derive from it a sort of pleasure that may be called æsthetic. We feel drawn by fellow-feeling towards one who has attended to the same objects as ourselves, or who has seized and put into vivid prominence what we have felt without ever having expressed. The coincidence of mind with mind is always productive of the agreeable effect of mutual sympathy, and, in some circumstances, there is an additional effect of pleasing surprise. Thus, when an artist not merely produces in his picture those features of the original that strike every one, but includes all the minuter objects that escape the notice of the generality, we sympathize with his attention, we admire his powers of observation, and become, as it were, his pupils, in extending our study and knowledge of nature and life. We feel a pungent surprise at discovering, for the first time, what has been long before our eyes; and so the minute school of artists labor at this species of effects. Moreover, we are brought forward as judges of the execution of a distinct purpose; we have to see whether he that is bent on imitation does his work well or ill; and if our verdict is favorable, our admiration is excited accordingly. There is, too, a certain exciting effect in the reproduction of some appearance in a foreign material, as when a plain surface is made to yield the impression of solid effect, and canvas or stone imitates living humanity. Finally, the sentiment of reality and truth, as opposed to fiction or falsehood, appealing to our practical urgencies, disposes us to assign a value to every work in which truth is strongly aimed at, and to derive an additional satisfaction when fidelity of rendering is induced upon the charms peculiar to A. Thus imitation—which, properly speaking is a mere accident attaching to sculpture, painting, and poetry, and has no place in music or architecture—may become the center of a small group of agreeable or acceptable effects. These effects are the more prized, that we have been surfeited with the purely æsthetic ideals. We turn refreshed from the middle-age romance to the graphic novel of our own time.

Besides being a source of pleasure, art is frequently spoken of as having an elevating and refining influence on the mind and character; for which reason it is considered a proper object of public encouragement in civilized communities. This circumstance is owing to the higher nature of artistic pleasure as above described, the taste for which helps to rescue mankind from the exclusive dominion of sensual and selfish enjoyments. At the same time, we must admit that the devotion to art may be itself excessive, and have the effect of withdrawing men too much from the urgency of practical life, rendering them a prey to political despotism, as well as indifferent to moral principles. Instances are not wanting to justify this remark.

See Dugald Stewart's *Philosophical Essays*, Part II., and Bain on the *Emotions and the Will*, p. 247.

**ART, HISTORY OF.** The history of the origin and development, growth and decline of beautiful artistic forms, constitutes a portion of the history of civilization. As regards each particular people, the history of their efforts to conceive and express absolute perfection, or what is commonly called ideal beauty, in form and color, is, with the single exception of the history of their speculative opinions, the most reliable test of the stage of progress which they have attained. Nor is it as an indication of their command over physical nature, of the abundance of their external resources, or even of their intellectual activity alone, that the history of the art of a people is thus important. It determines their moral, and even, in a certain sense, their religious position, for the inseparable connection between the beautiful and the good is in no way more clearly manifested than in the fact that the first inroads of demoralization and social disorder are invariably indicated by a diminution in the strength and purity of artistic forms. It has been usual to include under the term history of art merely the history of the arts of form, including architecture, but excluding, of course, poetry and music, though these latter, again, are generally included when we speak of the fine arts. See ART.

The classical nations of antiquity were not insensible to the importance of tracing the development of that rich artistical life which they had originated, and we accordingly find the germs of artistic history in Pliny, Quintilian, Pausanias, and others. In the middle ages, every trace of a general historical treatment of art disappears, though casual remarks and incidental notices on the subject of artists and the arts are abundant, particularly in such works as the *Liber Pontificalis* of abbot Anastasius, who is commonly known as "the librarian," in consequence of his having filled that office at the Vatican in the 9th century. But a history of art, in the sense which we have here assigned to the term, made its appearance in the world for the first time on the revival of letters, in the 15th and 16th centuries; when the artistic treasures of the heathen world, which had come upon mankind as novelties, fell to be contrasted with that peculiar type which art had assumed under Christian influences during the middle ages, on the one hand (see BYZANTINE ART), and on the other with that rich harvest of fresh invention which ripened during the long lives of Leonardo da Vinci (q.v.) and Michael Angelo (q.v.), in the period of which Raphael's (q.v.) short career may be regarded as the noonday. Whilst Vasari (q.v.) traced the great epochs of Italian art—from a biographical point of view only, it is true—in his celebrated work, the students of classical literature collected such expressions of opinion on artistic subjects as the writings of the ancients contained, and Palladio, Ligorio, Vignola, and others measured ancient buildings and their constituent members. In this way a vast mass of information on artistic subjects was brought together. But though the materials which might have served for a history of art were thus supplied, it was a long time afterwards before anything like proper historical treatment arose; and the knowledge of ancient art which had been gained, was applied to their respective purposes by artists on the one hand and philologists on the other. As regarded modern art, the biographical method of Vasari was adhered to, and to this circumstance we are indebted for the innumerable artistic anecdotes which have been preserved. The remarkable variations in style which exhibited themselves between the 16th and 18th centuries, gave rise to a species of historical treatment which had for its object the discovery of the common features by which the artists of the respective periods were distinguished. But the history of style, strictly speaking, begins with Winckelmann (q.v.), who was the first to divide ancient art into epochs, and to trace its connection with the general history of human progress. It was from this period that the history of art came to be regarded as a branch of the history of civilization. Even where the biographical method continued to be followed, it was henceforth with this difference, that the division into schools took the place of mere chronological arrangement. The strongly classical tendency which exhibited itself towards the end of last century, and the romantic reaction and consequent admiration for the middle age which succeeded, though both must be regarded as one-sided influences, had an unquestionable effect in calling attention to what was really great in the artistic productions of these respective periods; and during the present century, the history of art has gradually assumed a more important place as a department of general history. It was only in very recent times, however, that a complete artistic history appeared in Kugler's *Handbook of the History of Art*, which has been partially translated into English, and edited by Sir Charles Eastlake. In the original work, which is very excellent, the immense mass of material which the subject offered has been arranged in periods, and treated in such a manner as to present a sketch which is complete in itself, whilst at the same time its connection with and dependence on general history, social, political, and philosophical, are carefully indicated throughout. Alongside of Kugler's history, that of Schnaase falls to be mentioned—a work giving a philosophical and historical account of the origin of the various styles, and their connection with each other; as also the works of Lübke, Springer, and Carriere. Kinkel's history of Christian art has unhappily remained incomplete. Waagen's works on art and artists in England, France, and the other countries by which Germany is surrounded, are the best artistic handbooks for the traveler. Those which have reference to England have been translated. There are many other historical works of importance on special departments and separate schools of art, monographs and the like, but, with the exception of Stirling's *Annals of the Artists of Spain*, and Velasquez and his Works, very few belong to our own literature.

**ARTA**, the ancient *Ambracia*, a t. of Albania, in lat.  $39^{\circ} 8' \text{ n.}$ , and long.  $20^{\circ} 50' \text{ e.}$ , 7 m. from the northern coast of the gulf to which it gives name, and 39 m. s. from Janina. It stands on the left bank of the river Arta, the ancient *Aracthus*, whence the modern name. It is the see of a Greek bishop, and is governed by a bey. Pop. 8000. It has a considerable trade, and manufactures, chiefly of cloths and leather; the floccata, or "shaggy capote," alluded to in Byron's earlier poems, is greatly esteemed; but the town has never recovered from the disasters of 1828, when it was stormed by the Greek patriots under Marco Botzaris. Portions of the old walls, which were of great strength, and the foundations of the acropolis, are the only relics of Hellenic times. Remains of the lower empire exist in a convent founded 845 A.D. by the empress Theodosia.

The ancient city of Ambracia, founded by a Corinthian colony about 635 B.C., was at one time a flourishing independent state, with a considerable territory. It was ruined in the struggle with the Amphilochians, and subsequently became subject to Philip of Macedon. Pyrrhus made it the capital of Epirus, after which it fell into the hands of the Ætolians, and lastly of the Romans.

**ARTA.** See **AMBRACIA**.

**ARTA, GULF OF**, an arm of the Ionian sea, 25 m. long and 10 wide, forming part of the boundary between Turkey and Greece. Under its ancient name of the Ambraciote gulf (*sinus Ambracius*), it separated Epirus and Acarnania. At its entrance on the s. is the promontory of La Punta, the ancient Actium (q. v.).

**ARTABAZUS**, the name of several distinguished Persians in the times of the Achæmenidae. When Xerxes advanced against Greece, A. led the Parthians and Chorasmians. At a later period he warned Mardonius, but in vain, against engaging in battle at Platea; and on the first indications of defeat, he withdrew his own division, amounting to 40,000 men, from the field, and succeeded, though with great difficulty, in forcing his way through the wilds of Thessaly, Macedonia, and Thrace to Byzantium, where he crossed to Asia. Subsequently, he acted as negotiator between the Spartan Pausanias and Xerxes.—Another A. was general under the Persian king, Artaxerxes Mnemon, and revolted against Artaxerxes Ochus in 356 B.C. For this offense he appears to have been forgiven; and subsequently we find him accompanying king Darius after the battle of Arbela. Alexander rewarded his fidelity by appointing him satrap of Bactria.

**ARTANTHE.** See **MATICO**.

**ARTAXATA**, the ancient capital of Armenia, on the Araxes, where Hannibal took refuge when Antiochus could no longer protect him. The Carthaginian is said to have superintended the building of that city, which was named from the king Artaxais. It was destroyed by the Romans, 58 A.D., rebuilt by Tiridates, and called Neronia, in honor of Nero, who had granted the kingdom to Tiridates. It was taken and partially destroyed by the Persians in 370, and in 450 it was the seat of an ecclesiastical council over which Joseph, the patriarch, presided.

**ARTAXERXES**, the name of several Persian kings. A. I., surnamed *Longimanus*, the second son of Xerxes, escaped from the conspiracy of Artaban and others, and ascended the throne in 465 B.C. His long reign, extending to 425, was marked by a decline of power.—A. II., surnamed *Mnemon*, succeeded his father, Darius II., in 405 B.C. After gaining the victory over his brother Cyrus, he became involved in war with Sparta, which ended with the Antalcidean treaty of peace. He d. in 361.—A. III., surnamed *Ochus*, was the son and successor of the former, and reigned in the true style of oriental despotism until 338 B.C. One of his most daring exploits took place in Egypt, where he caused the divine bull Apis to be slaughtered and cooked as ordinary beef. A. III. was poisoned in 338 by his eunuch Bagoas. It is said that his flesh was eaten by cats, and that hilts for scimitars were made of his bones.—The founder of the new Persian dynasty of the Sassanidae (which ruled from A.D. 226 to 651) was named A.

**ARTEDI, PETER**, a celebrated naturalist, was b. on the 22d of Feb., 1705, at Anund, in the province of Angermannland, Sweden. He was at first designed for the church, and entered the university of Upsala, intending to pursue the usual course of philosophy and theology; but he soon abandoned all thought of the ministry, and betook himself to medicine. In 1728, Linnaeus went to Upsala, to study the same science, and a close intimacy sprang up between the young men. They worked together, and, to a certain extent, on the principle of a division of labor. Physiology, chemistry, and mineralogy they pursued in common; but to this A. added ichthyology, and Linnaeus ornithology and entomology. In 1734, A. sailed for England, and Linnaeus went to Lapland, each having made the other his heir and executor of all his scientific documents. While in London, A. wrote the preface to his *Ichthyologia*. Next year he went to Leyden in Holland, where he found Linnaeus just arrived from the north. Each showed the other the results of his labors. A.'s useful career was abruptly ended, on the 21st of Sept., 1735, by his falling into one of the canals near Amsterdam.

A.'s only complete work is the *Philosophia Ichthyologica*. The *Synonymologica* is described as a work of extraordinary labor, but somewhat confused. Linnaeus faithfully performed his duty as his friend's executor. He arranged, corrected, and completed his manuscripts, and published the whole, together with a life of the author, in 1738. According to Cuvier, the great work of A. is the first named, which gave a truly scien-

tific character to the study of fishes. The only error of any magnitude which occurs in it is including the cetaceæ among fishes. A. was also a distinguished botanist. He was the first to indicate, as a special characteristic, the presence or absence of involucre in the umbelliferous plants, whose species are so difficult to distinguish from each other. Linnæus has called a genus of these, in memory of his friend, *artedia*.

**ARTEMIDORUS** OF **EPHESUS**, a geographer who lived about 100 B.C., who voyaged around the Mediterranean, the Red sea, and probably parts of the Indian ocean. He visited Iberia and Gaul, and corrected some of the errors of Eratosthenes. His work (in eleven books) is nearly all lost, but it was highly prized and frequently quoted by Greek and Roman writers. A few fragments have been found, and an abridgment, made by Marcianus, still exists. From what is known, the loss of A.'s work is deeply regretted, as he gave most minute accounts of the manners and customs of the people which he visited.

**ARTEMIS.** See **DIANA**, *ante*.

**ARTEMISIA**, queen of Caria (circa-350 B.C.), was the wife of Mausolus, and celebrated for the magnificent mausoleum which she caused to be erected to her husband's memory. See **MAUSOLEUM**.—Another A., queen of Halicarnassus, accompanied Xerxes in his expedition against Greece, and distinguished herself at the battle of Salamis (480 B.C.); she ended her life, in consequence of an unfortunate attachment, by leaping from a rock.

**ARTEMISIA**, a genus of plants of the natural order *compositæ*, sub-order *corymbifera*, in which the flowers of the disk are hermaphrodite, those of the ray in one row, the bracts forming a roundish imbricated head, the receptacle naked or hairy, the achenia obovate, and destitute of pappus. The heads of flowers are numerous and small; the leaves generally much divided. There are many species, herbaceous plants and shrubs, natives chiefly of the more temperate regions of the eastern hemisphere. They have generally an aromatic smell, more or less agreeable, and a warm, sometimes rather acrid and bitterish taste.—To this genus belongs **WORMWOOD** (*A. absinthium*), the *apsinthion* of the ancient Greeks, to whom its medicinal properties were well known. It is a native of Britain, the continent of Europe, and the northern parts of Asia, growing in waste places, by waysides, etc. It is a perennial, 2 to 4 ft. high; its leaves bipinnatifid and clothed with a silky down, and its small hemispherical drooping heads of flowers are of a dingy yellow color, and are produced in axillary panicles. It is aromatic and better, containing a bitter principle and an essential oil, both of great strength, upon account of which it is used in medicine in various forms (oil, extract, tincture, etc.), as a stomachic and anthelmintic or vermifuge. It was formerly in much use as a febrifuge. It is a plant very frequently to be found in cottagers' gardens, occupying an important place in their domestic pharmacopœia. It is an essential ingredient in a number of compound medicines. Its roots, and those of some other species of this genus, have been recommended in epilepsy.—**SEA WORMWOOD** (*A. maritima*, including a variety which has been called *A. gallica*), a native of salt-marshes in Britain and other parts of Europe, possesses similar properties, and is occasionally used for the same purposes; as, also **ROMAN WORMWOOD** (*A. pontica*), a native of the middle and south of Europe, but not of Britain—**TARTARIAN WORMWOOD** (*A. santonica*), a native of Tartary, Persia, and other parts of the east; and **INDIAN WORMWOOD** (*A. indica*), a native of the Himalaya, abounding at elevations of 2000 to 6000 ft. Indian wormwood grows to the height of 12 ft. It is considered in India a powerful deobstruent and antispasmodic. **TREE WORMWOOD** (*A. arborescens*), a native of the s. of Europe and the Levant, is also larger and more shrubby than the common wormwood, which, in characters and qualities, it much resembles.—The dried flower-buds of a number of species of A. are sold under the names of **WORMSEED** and of *semen contra*, *semen cinæ*, *semencine*, etc., and have long been in much repute as an anthelmintic. *A. santonica*, and *A. sieberi* (or *A. contra*), a native of Palestine, are believed to yield much of the wormseed which is brought from the Levant, also *A. judaica*, a native of the east and of Barbary, which is regarded as the principal source of the Barbary wormseed. The flower-buds of *A. glomerata*, *A. lerehiana*, and *A. pauciflora*, natives of the banks of the Volga, are also said to form part of the wormseed of the shops; and those of *A. vahliana* are collected in the n.e. of Persia, and form the *semen cinæ levanticum* or *semen cinæ in grains*. The flower-buds of *A. coerulescens*, a Mediterranean plant, which is said to have been found on the sea-coast of England, form the anthelmintic called *semen seriphii* or *barbotine*. Those of *A. camphorata*, another native of the south of Europe, are used in the same way. Even those of *A. absinthium* and *A. vulgaris* are used under the name of wormseed.—The plants from which the bitter aromatic liquor called *extraît, eau* or *crème d'absinthe* is prepared, are small low-growing species of A. (*A. mutellina*, *A. glacialis*, *A. rupestris*, *A. spicata*, etc.), found on the Alps, and known to the inhabitants of the Alps by the name of *genipi*. This liqueur, generally diluted with water, is sometimes used by persons so devoted to the pleasures of the table that they cannot wait for the natural return of appetite, and also by those who really suffer from weakness of digestion. It is a useful and agreeable stomachic, and is very popular in France—**MUEWORT** (*A. vulgaris*), a common native of Britain and of the continent of Europe, often found about ruins and in waste places, grows to the height of 3 or 4 ft., with pinnatifid leaves and somewhat racemed small flowers, which have each five florets of the ray. It emits, when rubbed, an agree-

able smell, and has a bitter taste. In Germany, the young shoots and leaves are used in cookery for seasoning. It is used also for the same medicinal purposes as wormwood, but is weaker. Its leaves, and those of some of the other species, are used as fomentations for cleansing and healing wounds.—SOUTHERNWOOD (*A. abrotanum*) is a shrubby plant with long straight stems, 3 to 4 ft. high, the lower leaves bipinnate, upper leaves pinnate, their segments hair-like. It is a native of the s. of Europe and middle parts of Asia, and has long been a favorite plant in cottage-gardens in Britain. It has an aromatic and pleasant odor. The leaves are used to drive away moths from linen; and in some parts of the continent of Europe, as an ingredient in the manufacture of beer. The smell of this plant appears to be peculiarly disagreeable to bees, which retreat from it; and a little branch of southernwood is sometimes efficaciously used when they are swarming, to promote their ascent into the new hive placed over them.—TARRAGON (*A. dracunculus*) is a perennial plant, a native of Siberia, and long cultivated in gardens in Britain. It has a branching stem 1 to 1½ ft. high, with narrow leaves. It is fragrant, and has an aromatic smell and taste. The leaves and tender tips are a favorite ingredient in pickles. An infusion of the plant in vinegar is used as a fish-sauce.—The leaves of *A. maderaspatana* are regarded in India as a valuable stomachic, and are also used in anodyne fomentations.—MOXA (q.v.) is prepared by the Chinese from the leaves of *A. mosi* and other species, the whole surface of whose leaves is covered with a thick down.—*A. acetica*, a Persian species, is said to have a strong odor of vinegar.

ARTEMISTUM, the name of the northern coast and of a promontory in Eubœa, opposite the Thessalian Magnesia, and named from the temple of Artemis; belonging to the t. of Histiaea. Off this coast occurred the conflict of the Grecian fleet with the fleet of Xerxes.—The name also of a mountain between Argolis and Arcadia, now Mt. Turniki, on which was a temple; also of a promontory in Caria, which was crowned with a temple to Artemis.

ARTERECTOMY, or the opening of an artery, is an operation that has been strongly advocated in those cases in which it is desirable to produce a more decided and immediate effect upon the cerebral circulation (as in severe forms of sanguineous apoplexy) than could be produced by ordinary venesection. It is supposed by some surgeons to relieve pressure on the brain more efficiently than opening the jugular vein could do; and whether this is the case or not, it is a simpler and less dangerous operation. The only vessel operated on is either the temporal artery itself or one of its main branches. The operation is a simple one, but should, of course, only be undertaken by a surgeon. To arrest the flow of blood when sufficient has been taken, the artery should be completely divided, and after the parts have been sponged, a compress, or small pad, should be applied to the wound, and secured by a bandage, which must be carefully adjusted, so as, if possible, to remain undisturbed for four or five days, when it may be removed, and the wound covered with a strip of plaster.

ARTERIES, DISEASES OF. Most of the important morbid conditions of the arteries are those which are occasioned by the deposition of *atheroma* (a Greek word signifying a tumor or deposit containing matter like *athērē*, meal or groats) on the free surface of the inner coat of the vessel; a new inner lining to the artery being thus furnished. As *atheroma* has the effect of weakening, enlarging, and occluding arteries, according to the extent and period of the deposition, it is expedient briefly to notice the most important stages of its progress. In the earliest stage, *atheroma* consists of a thin, soft, and clear membrane, lining a part or the whole of the tube. It seems to be a mere addition to the artery, in whose original coats there is no appearance of disease. It is most probably a deposit on the inner surface from the blood. On the inner surface of the new coat, a similar layer gradually forms, and in course of time, becomes the foundation of subsequent formations; and when many strata have thus been deposited, the collective mass ceases to be transparent, and becomes converted into an opaque material similar to hardened albumen, and finally to ligament. Until this consolidation occurs, the coats of the artery are not much affected; but by their adhesion to the hardened deposit, they lose their strength, elasticity, and natural color, and their functions are destroyed. The indurated deposit may now undergo one or other of these changes: it may either soften in its interior, in which case it degenerates into a pulpy mass of cholesterine, oil-globules, albuminous and chalky molecules; or it may be converted into a layer of hard, chalky, bone-like matter. This latter change (cretification or ossification) takes place only in the external oldest layers of thick deposits; and nothing intervenes between the bony plate and the middle coat of the artery, for the inner or lining coat partakes in the morbid change. It is obvious that either of these changes (softening or hardening) must gradually lead to disease of the arterial coats generally. The process of change is slow, and the change itself can only be detected in the living subject when it is in an advanced stage. In the radial artery and others which lie superficially, the finger can often detect rings or tubes of chalky matter. Most commonly, however, the state of the arteries is detected by some secondary symptom.

Atheromatous deposit is at first attended with a narrowing of the calibre of the vessel, varying with the thickness of the deposit, and most marked at the points of bifurcation. Smaller arteries may be completely obliterated, whilst the larger arteries may be very much contracted. Thus, the common iliac has been found to have its canal dimin-

ished by about one half, and the great ascending branches of the arch of the aorta, the subclavian and carotid arteries, have been found very nearly closed. A later consequence of the same disease is dilatation of the vessel. The power of the outer coats being insufficient to compress the deposit and to close in upon the blood, by which each contraction of the left ventricle of the heart distends them, they remain wide and distended during the relaxation of the ventricle, and the artery thus slowly expands; the enlargement being most marked at parts where there is most obstruction to the blood-current, as, for example, in curved arteries. These dilatations are apt to terminate in regular aneurism. The changes which we have already described have an effect on the retractile power of the arteries. A healthy artery, if cut across, may shorten to the extent of an inch and a half, as has been actually measured by Mr. Moore ("Diseases of the Arteries," in Holmes's *System of Surgery*, vol. iii. p. 329); but the retractile power is destroyed by the deposition of bony rings or plates. But although incapable of shortening, the arteries sometimes become abnormally lengthened, and consequently become not only dilated, but also tortuous. If the outline of superficial arteries thus affected be watched, each pulsation of the heart is seen to increase their curvature; and deep-seated arteries (as the iliac) are thus often forced from their normal positions. Another condition involving much danger is this: an ossified artery loses the smoothness which the interior of the vessel ought to present, and from the displacement or cracking of a bony plate, there may be sharp, rough projections exposed, to which the fibrin of the circulating blood may adhere. These little clots becoming detached, may be carried with the blood till they become arrested, and plug up an artery, thus presenting cases of embolism or thrombosis (q.v.). Again, the relation of this disease to accidents and surgical operations on arteries is obvious. A blow may crush a diseased artery, when a healthy elastic vessel might have escaped injury. Such a slight movement as suddenly lifting the arm to the head, for the purpose of securing the hat in a sharp gale, has been known to have been followed by aneurism of the axillary artery. A ligature applied to any ossified artery, is very apt to cause it to break, and the difficulty of securing such vessels is often very great. It is to this form of disease that most of the failures of operations for aneurism are due. Having thus noticed the most important changes which are induced in the arteries by atheroma, and the evil consequences to which they may give rise, we shall now direct attention to an important cause of occlusion—that, namely, in which the canal is closed by an imported foreign body, and especially by fibrinous plugs originally formed in the heart, and transported to other parts in the stream of the blood. When a large artery, as, for example, the principal artery of one of the limbs, is "suddenly plugged in its higher part, a sensation of severe pain is commonly the immediate result of the accident. In some cases, the pain extends along the course of the vessel, which, though pulseless, is extremely tender; in others, the suffering is referred to some distant part of the limb, as, for instance to the calf. Signs of a deficient circulation succeed, and they may amount to pallor, loss of temperature, numbness of the surface, or even to that 'torpor' which is observed to precede the total death of a limb in certain cases of injuries of vessels. Such torpor implies not only a loss of circulating blood, but also a cessation of all feeling and motor power in the limb."—Moore, *op. cit.*, p. 335. Although gangrene (q.v.) is always to be feared as the result of an obstructed artery of large size, it does not invariably follow; as a collateral circulation may be established, and the life of the limb may be thus saved. Very young persons will endure the obliteration of very large vessels without gangrene; and a case is on record (*Med. Chir. Trans.*, vol. xxix. p. 214) in which "all the main arteries of both upper extremities and of the left side of the neck were reduced to solid cords," and yet no gangrene ensued. From the description of the symptoms, the nature of a case of sudden occlusion of a large artery by a plug may possibly be recognized, or, at all events, suspected even by a non-professional observer. Medical aid must at once be sought. The early indications of treatment are to preserve the temperature of the part, to favor the establishment of a collateral circulation, to protect the limb from irritation or injury, to give nourishing blood-making food, and to relieve pain by the judicious use of opiates. The later treatment, if the affection is not checked, is that which is described in the article GANGRENE.—*Arteritis*, or *inflammation of the arteries*, was a disease which was formerly recognized by physicians. No such specific general disease is now believed in; but the changes which have been already described as occurring in consolidated atheromatous deposits—either softening or ossification—are accompanied by an unnaturally vascular condition of the attenuated arterial walls, extending to true local inflammation, and even to suppuration.—*Aneurism* (a tumor containing blood, and communicating with the cavity of an artery) has been considered in a special article.

**ARTERY** (Lat. *aer* and *terō*) named from the old idea that these tubes were air-carriers. Arteries are the vessels through which the blood passes from the left side of the heart to the tissues. The structure of an arterial tube is very complex, and a section of it may be roughly subdivided into three layers, called the coats of the artery: an external, which is elastic and distensible; a middle, which is muscular, contractile, and brittle; an internal, also brittle, smooth, and transparent, being lined with epithelium on the side washed by the blood. The tube is also enveloped in cellular tissue, termed the *sheath* of the A. When an A. is wounded by a sharp instrument, the effect varies

with the direction of the cut. Thus, if longitudinal, the edges may not separate, and the wound may heal without much bleeding; if oblique or transverse, the edges gape, and a nearly circular orifice allows of a profuse hemorrhage. If the A. be completely divided, its walls do not collapse like those of a vein, but pass through certain changes provided by nature to prevent fatal bleeding. The cut orifice contracts, and also retracts into its cellular sheath; this checks the flow of blood, a clot of which shortly forms on the outer side; then another forms inside the vessel; and together, they stem the flow, till the cut edges of the A. have time to throw out lymph (see ADHESION), and heal as wounds of other tissues. When an A. is compressed by a ligature, the brittle inner and middle coats crack, curl inwards, and heal. See BLEEDING.

Subdivisions of arterial wall.

The arteries of the human body are all offsets, more or less direct, of the aorta. As each main trunk passes into a portion of the body, it divides into two principal divisions: one, which breaks up into branches for the supply of the tissues in the vicinity—the A. of supply; and another, which passes almost branchless to supply the parts beyond—the A. of transmission. These, however, anastomose (q.v.) freely, so that the distant tissues are not solely dependent for their supply on only one arterial trunk. Thus, the femoral A. divides in the groin into the profunda, or deep femoral, to supply the thigh, and the superficial femoral, to supply the leg below the knee. Again, the common carotid divides into external carotid, to supply the neck and head, and the internal carotid to supply the brain. Although arteries have generally the same distribution or arrangement of branches, they occasionally vary, and thereby are apt to puzzle a superficial anatomist. Mr. Thomas Nunn of London, an excellent human anatomist, has clearly shown that these anomalies in arterial distribution are all governed by the law of arterial distribution just mentioned, a fact which not only simplifies the study of arterial anatomy, but assists the operative surgeon out of perplexing positions. The principal arteries will be considered under their distinctive names. The best authority on arteries is the splendid work of R. Quain. See ARTERIES, DISEASES OF.

**ARTESIAN WELLS** are perpendicular borings into the ground, through which water rises, from various depths, according to circumstances, above the surface of the soil. The possibility of obtaining water in this way in a particular district depends on its geological structure. All rocks contain more or less water. Arenaceous rocks receive water mechanically, and according to their compactness and purity, part with a larger or smaller proportion of it. A cubic yard of pure sea-sand can contain, in addition to the quantity of dry sand which occupies that space, about one third of its bulk of water. It would part with nearly the whole of this into a well sunk in it, and regularly pumped from. Chalk and other rocks, composed of fine particles, closely compacted together, contain as large a proportion of water; but from the power of capillary attraction, little or none of this water would be drained into a well sunk in such rock. From the existence, however, of numerous crevices in chalk through which the water freely flows, and from the general presence of a larger quantity of water than the porous rock is able to retain, wells sunk in chalk often yield water. There is yet a third class of rocks, which are perfectly impervious to water: such are clays, which are absolutely retentive, neither allowing water to be obtained from them nor to pass through them. When such rocks occur in basins (q.v.) in alternating layers, and in such order that pervious beds are inserted between impervious ones, it is evident that if a perforation is made through the retentive barrier-bed in the lower portion of the basin, the water contained in the water-logged strata will rise through the bore to a height depending upon the pressure of water which has accumulated in the confined sloping space between the two impervious beds. There is a number of porous beds composing the cretaceous measures, resting on the impervious gault, and these, again, are covered by the equally impervious series of the London clay, which form the strata on the surface, and extend to a considerable depth. The edges of the chalk-beds are largely exposed in the higher grounds around London; the water falling on the whole area of these exposed edges, sinks into the more or less porous cretaceous beds, and would, in course of time, by continued accessions, fill up the basin, were it not prevented by the clay above. By driving a bore through this superior bed, the inferior water-logged strata are reached, and the subterranean water rises to the surface, and flows continuously, by means of hydrostatic pressure.

Many such wells exist in London and its vicinity; those which form the ornamental fountains in Trafalgar square descend into the upper chalk to a depth of 393 ft. The most famous artesian well, perhaps, is that of Grenelle, in the outskirts of Paris, where

the water is brought from the gault at a depth of 1798 ft. It yields 513½ gallons of water in a minute, propelled 32 ft. above the surface; temperature, 81°·7 F. An artesian well in course of construction at Pesth, yielded, at a depth of 3100 ft., 175,000 gallons of water per day, of a temperature of 161° F., projected 35 ft. above the surface. It is to be sunk till the water reach 178° F.

It is believed that the Chinese have been long acquainted with A. W. They have been in use for centuries in Austria, especially in the neighborhood of Vienna, where they are very abundant. No knowledge existed as to their source, and consequently the boring for them was engaged in and conducted in a rude and empirical manner. An excavation was made till a bed of clay was reached; on this a perforated mill-stone was laid, and through the hole the clay was bored until water rose. As soon as geology took the position of a science, and the theory of A. W. was propounded, the engineer was able, after the geological survey of a district, to discover whether a supply of water could there be obtained in this way. Already, districts formerly dry and arid have received a plentiful supply of water by means of such wells, and many more applications have yet to be made: it seems likely that erelong Africa's deserts may thus be converted into fertile plains. In an official report of the Algerian government for 1856-57, it is stated that artesian borings had been executed in the Sahara of the province of Constantine with remarkable success. The first attempt, after a few weeks' labor, produced a constant stream, forming a perfect river, and yielding 4010 quarts of water per minute, at a temperature of 78° F. There are now upwards of 75 such borings in the Sahara, yielding an aggregate of 600,000 gallons per hour. The result is proving beneficial not only to the country materially, but also to the character and habits of its nomadic Arab inhabitants. Several tribes have already settled down around these wells, and forming thus the centers of settlements, have constructed villages, planted date-palms, and entirely renounced their previous wandering existence.

A. W. have supplied a portion of the data upon which the internal temperature of the earth has been calculated. They have their origin below that zone which is affected by the changing superficial temperature of the seasons, and consequently the water is of a constant temperature. Thus the Grenelle artesian well has a temperature of 81°·7 F., while the mean temperature of the air in the cellar of the Paris observatory is only 53°. MM. Arago and Walferdin observed the temperature as the work proceeded, and found that there was a gradual and regular increase downwards. The latter gentleman made a series of very accurate and careful observations on the temperature of two borings at Creuzot, within a mile of each other, commencing at a height of 1030 ft. above the sea, and going down to a depth, the one of 2678 ft., the other about 1900 ft. The results, after every possible caution had been taken to insure correctness, gave a rise of 1° F. for every 55 ft. down to a depth of 1800 ft., beyond which the rise was more rapid, being 1° for every 44 ft. of descent. There are several very deep borings in the United States.

**ARTEVELDE, JACOB**, a brewer of Ghent, celebrated as a popular leader in the 14th century. In the war between England and France, he gave his aid to the former, while the counts of Flanders supported the latter. A., after gaining great advantages over the party of the nobles, went too far when he proposed that the son of Edward III. of England should be elected count of Flanders. For this the Flemings were not prepared, and, in consequence, A. was killed in a popular insurrection, Aug. 19, 1345. His son Philip, in 1381, was leader of the people of Ghent in their civil war against Bruges, and gained a victory over count Louis. The latter was afterwards assisted by Charles VI. of France, and Philip A. was defeated and slain in the battle of Rosbeke, 1382. The history of A. has been several times treated dramatically. In England, Sir Henry Taylor, a writer of eminence, has produced a beautiful "closet-play;" entitled *Philip Van Artevelde* (1834).

**ART EXHIBITIONS.** Public displays of the works of living artists, with the view of affording gratification and instruction to the community on the one hand, and, on the other, of procuring purchasers for the works exhibited, have taken place in most of the principal towns of Europe, for more than a century and a half. Though sometimes connected with art unions (q.v.), A. E. are in reality much older institutions. Still, as the offspring of a necessity which did not exist in earlier times, they are essentially modern. So long as artists were chiefly patronized either by the church, by their respective governments, or by individuals of sovereign rank, their works were placed either in churches, in public buildings, or in palaces, and were thus continually exhibited to the public; but when private patronage came to be their chief support, and their works, if sold at all, were certain to be buried in private houses, the necessity for making arrangements by which they could be displayed to the public either before they were disposed of, or afterwards with the consent of their owners, became apparent. We have mentioned under **ART UNIONS** that, till aided by these latter institutions, A. E. for the most part did not succeed in effecting the objects which their promoters had in view. The earliest collective art exhibition was probably that of the members of the academy of the fine arts at Rome; anything of the kind which had previously existed being confined to the works of a particular artist and his pupils,

enriched perhaps by a few contributions from his friends. Something of this earlier character probably attached to these Roman exhibitions; and the first art exhibition, in the sense in which we now understand it, seems to have been that of the French academy in 1673. From 1745, down to the period of the revolution, this exhibition, which from its commencement had been confined to the works of members of the academy, took place biennially. During the revolution it was thrown open to foreign artists, and in 1796 it was again made annual. An exhibition was attempted in England in 1760, but it was not till 1769 that the regular exhibitions of the royal academy commenced. They have since gone on, not only without interruption, but with increasing energy. The works exhibited in 1760 were only 130, the number of exhibitors being 69; in that of 1875 there were exhibited 1408 works by 835 artists. The annual revenue which the academy derives from the fee of one shilling paid by each visitor has also been steadily increasing. The exhibition of the Scottish academy, which is the second in importance in this country, has existed since 1826. To the first exhibition, 178 works were sent by 27 contributors; the exhibition of 1876 consisted of 1090 works, which were contributed by 493 artists. The annual revenue of the Scottish academy derived from this source exceeds £2500. The only other exhibition of the same class in the United Kingdom is that of Dublin, which is supported by an annual grant from government—the exhibitions of London and Edinburgh being merely furnished with rooms erected at government expense. Several private societies in London and the provinces, however, have exhibitions for similar objects, and conducted on similar principles. Of these we may mention the British institution, the society of British artists, the national institution, the society of painters in water-colors, and its rival, the new society of painters in water-colors. There are also exhibitions in several of the large provincial towns, such as Manchester, Liverpool, Glasgow, etc. On the continent, wherever an academy of art exists, there is now an exhibition, which takes place for the most part annually, but sometimes biennially. In New York there is a permanent exhibition of the works of Düsseldorf artists; and from thence they are frequently carried for exhibition to the provincial towns of the Union.

The London exhibition of 1851, commonly known as the *great exhibition*, was not only on a larger scale, but introduced new features into these displays. Though confined to industrial objects and works of plastic art, it gave an impulse to A. E. strictly so called, which showed itself almost simultaneously in the great international artistic exhibition of Brussels; and even those exhibitions which have been formed more closely on its model—those of Dublin and New York in 1853, London in 1862, Paris 1867, Vienna 1873, Philadelphia 1876, and Paris 1878—have all included the fine arts.

ARTHABASKA, a co. in Canada, province of Quebec; 850 sq. m.; pop. '71, 17,611. The Grand Trunk railroad intersects. Principal town, St. Christophe d'Arthabaska.

ARTHRITIS, inflammation of the joints, arising from wounds, bruises, or surgical operations, and sometimes without apparent cause. All, or a part, of the joint may be involved, and sometimes the pain is intense, even producing delirium or convulsions. The usual treatment is compression by cloths wet with cold water, rest, cooling diet, and sedatives. In some cases cupping or leeching may be proper.

ARTHIPODA, the name now used instead of Cuvier's *articulata*. It includes *crustacea*, *arachnida*, *myriapoda*, and *insecta*, but excludes *annelida*. See ARTICULATA, *ante*.

ARTHUR, king of a tribe of ancient Britons, is supposed to have flourished in the 6th century. He is usually represented as a Christian prince who struggles bravely to maintain the liberty and faith of his country against the pagan Saxons, but there is no evidence for the statement that he fought against the Saxon Cerdic. Neither the Welsh bards nor Nennius assert this; in fact, it would seem to be merely an inference drawn from the supposition that the scene of A.'s exploits was the w. and s.w. of England. But Mr. Skene (*The Four Ancient Books of Wales*, vol. i., pp. 50-60) seeks to prove from an examination of Nennius (*Historia Britonum*, cap. 50), that the localities of the twelve great battles which A. fought are in Strathclyde, and therefore that he belongs to the region now called Scotland rather than to England. If there is any reality in his history at all, this is probably the correct view of it, but the influence of Geoffrey of Monmouth's fictions, and of the French romances, succeeded in fixing the Cumbrian prince in the more important part of the island. It is a curious fact that no mention whatever is made of A. by the venerable Bede, the oldest of our historians, or by the annalists of the *Saxon Chronicle*; and Mr. Skene's explanation, that these authorities only "record the struggle between the Britons and the Saxons s. of the Humber," is hardly satisfactory.

In the lays of the Welsh bards, supposed to be as early as the 6th and 7th c. (although no manuscript is extant of older date than the 12th c.), A. and his brave companions are celebrated, but modestly and without miracle. It is in Nennius that the legendary additions begin to develop themselves, though Mr. Skene does "not hesitate to receive the Arthur of Nennius as the historic Arthur." Then follow at a distance of three or four centuries the so-called Armorican collections of Walter, archdeacon of Oxford, from whom Geoffrey of Monmouth (q.v.) professes to translate, and in which the marvelous and supernatural elements largely prevail. Here for the first time the

magician Merlin comes into association with A. According to Geoffrey, A.'s father, Uther, conceiving a passion for Igrerna, wife of Gorlois, duke of Cornwall, is changed by Merlin into the likeness of Gorlois, and A. was the result. After his father's death, A. becomes paramount leader of the British, and makes victorious expeditions to Scotland, Ireland, Denmark, Norway, and even to France, where he defeats a great Roman army. During his absence, his nephew, Modred, revolts, and seduces prince A.'s wife, Guanhumara. A. returning, falls in a battle with his nephew; and is carried to the isle of Avallon to be cured of his wounds. Geoffrey's work apparently gave birth to a multitude of fictions which came to be considered as quasi-historical traditions. From these, exaggerated by each succeeding age, and recast by each narrator, sprung the famous metrical romances of the 12th and 13th centuries, first in French and afterwards in English, from which modern notions of A. are derived. In these his habitual residence is at Caerleon, on the Usk, in Wales, where, with his beautiful wife Guinevere, he lives in splendid state, surrounded by hundreds of knights and beautiful ladies, who serve as patterns of valor, breeding, and grace to all the world. Twelve knights, the bravest of the throng, form the center of this retinue, and sit with the king at a round table, the "knights of the round table." From the court of king A., knights go forth to all countries in search of adventures—to protect women, chastise oppressors, liberate the enchanted, enchain giants and malicious dwarfs, is their knightly mission. A Welsh collection of stories called the *Mabinogion*, of the 14th and 15th centuries, and translated into English by lady Charlotte Guest in 1849, gives an idea of the Arthurian legends. Some of the stories "have the character of chivalric romances," and are therefore probably of French origin; while others "bear the impress of a far higher antiquity, both as regards the manners they depict, and the style of language in which they are composed." These latter rarely mention A., but the former belong, as Mr. Skene puts it, to the "full-blown Arthurian romance." Early in the 12th c., the Arthurian metrical romance became known in Germany, and there assumed a more animated and artistic form in the *Parzival* of Wolfram of Eschenbach, *Tristan and Isolde* of Gottfried of Strasburg, *Erec and Iwein* of Hartmann, and *Wigalois* of Wirt. The most renowned of the heroes of the Arthurian school are Peredur (Parzival or Perceval), Tristan or Tristram, Iwein, Erec, Gawain, Wigalois, Wigamur, Gauriel, and Lancelot. From France, the Arthurian romance spread also to Spain, Provence, Italy, and the Netherlands, and was again retransplanted into England. One of the publications that issued from the press of Caxton (1485), was a collection of stories by Sir Thomas Malory, either compiled by him in English, from various of the later French prose romances, or translated directly from an already existing French compendium. Copland reprinted the work in 1557, and in 1634 the last of the black-letter editions appeared. A reprint of Caxton's *Kynge Arthur*, with an introduction and notes, by Robert Southey, was issued in 1817 (*The Byrth, Lyffe, and Actes of Kyng Arthur*, etc., 2 vols. 4to). The best edition is that by Thomas Wright (Lond. 3 vols., 1866) from the text of 1634. The name of king A. was given during the middle ages to many places and monuments supposed to have been in some way associated with his exploits, such as "Arthur's seat" near Edinburgh, "Arthur's oven" on the Carron near Falkirk, etc. What was called the sepulchre of his queen was shown at Melgely, in Strathmore, in the 16th century. The interest of the legends about king A. and his knights has been revived by the publication of Tennyson's *Idylls of the King* (1859 et seq.). See Turner's *History of the Anglo-Saxons*, Appendix; Ritson's *King Arthur*; De la Villemarqué, *Contes Populaires des Anciens Bretons* (2 vols., Paris, 1842); Grässe, *Die Grosse Sagenkreise des Mittelalters* (Leip. 1842); Skene's *Four Ancient Books of Wales* (Edin. 1868); Glennie's *Arthurian Localities* (1869).

ARTHUR, CHESTER ALLAN, b. Vt., 1830, of Scottish parents. His father was a Baptist minister, pastor of churches in Vermont and New York. Chester was the fifth of seven children; he graduated from Union college in 1848, studied law, and became legal partner of Erastus D. Culver, of New York. In 1852, A. had the management of the Lemmon slave case. The case was carried to the court of appeals, and in every removal was decided for the defendants (the slaves). Charles O'Connor was chief of the opposing counsel. In the case of a colored woman put off from a public car in New York, A. sued the company and recovered exemplary damages. A whig, and follower of Henry Clay, he early joined the republican party and became a leader. When the rebellion broke out, he was intrusted with the arming and subsisting of the troops raised in the state of New York, and was afterwards quartermaster-general, engineer-in-chief, and inspector-general. He was chosen colonel of the ninth regiment for immediate active service, but at the urgent request of gov. Morgan, declined the place, his military duties in the state being more important. Under his supervision 68 regiments of infantry, 6 battalions, and 10 batteries were sent to the field in four months in 1861. In 1871, he was appointed collector of the port of New York, and four years afterwards was reappointed with universal approval. He resigned after six years of service. In 1880, he was nominated as the republican candidate for vice-president.

ARTHUR, TIMOTHY SHAY, b. N. Y., 1809; an American story-writer. He has written a great number of moral and domestic tales and sketches which once enjoyed much popularity.

**ARTHUR, WILLIAM**, b. Ireland, 1819; an author and clergyman in England and Ireland. He was three years in India as a missionary; afterwards secretary of the Wesleyan church missionary society, and president of the British conference; in 1867 was chosen principal of the Wesleyan college in Belfast. He is the author of *Personal Reminiscences of a Mission to the Mysore*, *The Successful Merchant*, *The Tongue of Fire*, and other works.

**ARTHUR'S SEAT**, a hill in the immediate vicinity of Edinburgh, which rises to the height of 822 ft. above the level of the sea. The ascent is easy, and the prospect from the top unrivaled.

A. S. is supposed to derive its name from the British king of that name. When the hill received this appellation is not known; but as early as the close of the 15th c., Kennedy, the Scotch poet, mentions "Arthur Sate or ony higher hill."

The hill is formed of a mass of trap of various species, upheaved through the carboniferous strata of central Scotland, and presenting on the w. and s. sides, at the height of 570 ft., a perpendicular range of precipices, called Salisbury crags, 60 to 80 ft. high. The trap is in tabular masses, and has elevated and hardened the carboniferous sandstone, shale, and limestone beds, which dip e., and crop out on the w., besides being broken through and overflowed by the trap-rocks. In the center of the hill, the trap often incloses fragments of sandstone, and divides it by veins. The central and upper part of the hill, and the remarkable columns called "Samson's Ribs," consist of basalt. To determine the density of the earth, a series of observations was made in 1855 by lieutenant-col. James of the ordnance survey, on the attraction of A. S., or the amount of deviation from the vertical caused by its mass on the plumb-line. Calculation made the mean density of the whole earth 5.316 (water being 1), or about twice the mean specific gravity of the rocks forming the hill, which experiment gave as 2.710.

**ARTICHOKE**, *Cynara scolymus*, a thistle-like perennial plant, now growing wild in the s. of Europe, but probably a native of Asia. The genus *cynara* belongs to the natural order *compositæ*, sub-order *cynarocephalæ*, and is distinguished by the bracts of the involucre being fleshy at the base, and emarginate, with a hard point, and the receptacle fringed. *C. scolymus* has the radical leaves 3 to 4 ft. long, somewhat spiny, some of them pinnatifid, some undivided. The stem is 2 or 3 ft. high, branched, with large heads of violet-colored (sometimes white) thistle-like flowers at the summits of the branches. The involucre is tumid, and consists of fleshy, roundish-ovate, crenate, acuminate, imbricated scales. The seeds are elongated and quadrangular, with smooth and firmly attached pappus. The plant has been long cultivated for the sake of the delicate succulent receptacles of the heads of flowers, taken before the flowers expand, which are boiled and eaten, or, on the continent of Europe, eaten raw with salt and pepper. The part used is the same which is called the *cheese* in thistles by children, and is sometimes eaten by them. The tender central leaf-stalk is also occasionally used in the same way as that of the cardoon. Several varieties are in cultivation, differing in the more or less spiny leaves, and the more or less globose form of the head. Artichokes are generally propagated by rooted slips or suckers in spring. These are planted in rows about 4 ft. asunder, and 2 ft. apart in the row. The A. bed continues productive for several years. Seaweed is an excellent manure.—The cardoon (q.v.) belongs to the same genus.—The Jerusalem A. (q.v.) is a totally different plant.

**ARTICLE** (Lat. *articulus*, a joint) signifies in general a part of a systematic whole. Thus, we speak of the several articles of a confession; the articles of war; a leading article, etc.

The use of A. as a grammatical term arose as follows. In such a sentence as, "He found *that* (or *the*) man *that* he was looking for," the Greeks considered the defining particles as connecting the two parts of the sentence, and called them joints (Gr. *arthra*, Lat. *articuli*); the name was subsequently confined to the first of the two, the other being called the relative.

In English, there are two articles—the definite *the*, and the indefinite *a* or *an*; and other modern languages have corresponding words. But articles are not essential to language. The Latin had no articles, and the Greek, as well as the older Germanic languages, the Mæso-Gothic and Old Norse, e.g., had only the definite A. "In no language," says Dr. Latham, "in its oldest stage, is there ever a word giving, in its primary sense, the idea of *an* or of *the*. As tongues become modern, some word with a *similar* sense is used to express the relation. In the course of time, a change of form takes place, corresponding to the change of meaning."

The definite articles originate uniformly in demonstrative pronouns. Eng. *the* is only a weakened form of *that* (Anglo-Sax. *thæt*). The same is the case with Ger. *der*; and Fr. *le*, Ital. *il* and *lo*, and Sp. *el*, are all from the Lat. *ille*, "that." In like manner, *an* or *a* is from the old form of *one* (ane); Ger. *ein* is both *one* and *a*; and so are Fr. *un*, Ital. and Sp. *uno*, both from Lat. *unus* = *one*.

In the Scandinavian tongues, the article is attached to the end of the word; the Danish, for example, writes *kong-en*, the king; *hus-et*, the house.

**ARTICLES OF WAR** are regulations made for the government of the military and naval forces of the country. They are of three classes—1. Those relating to the army.

including therein the forces in India, according to the provisions of the 21 and 22 Vict. c. 106; 2. Those relating to the marine forces; and 3. Those relating to the navy.

1. *A. of W. for the Army.*—These regulations were formerly issued under the authority of the annual mutiny act (q.v.). By the 68th sec. of the army discipline and regulation act, 1879, articles of war can be made by the queen for the better government of the forces, other than the marines, to whom that act relates. The admiralty enjoys like power in the case of marines. The articles are to be judicially taken notice of by all judges and in all courts whatsoever; provided that no person shall by such A. of W. be subject to be kept in penal servitude, or to suffer any punishment extending to life or limb, except for crimes which the act declares shall be so punishable. And for the enforcement of such A. of W., a power is given to the crown to erect, or grant authority to convene, *courts-martial* to try and punish offenses according to the articles. In order, however, to limit the power conceded to the crown in this matter, it is enacted that nothing therein contained shall be construed to exempt any officer or soldier from being proceeded against by the ordinary course of law; and that when he is accused of any offense against a subject of the realm, punishable by the laws of the land, he shall be delivered to the civil magistrate. The offenses against which these A. of W. are directed, relate to the soldier's duties and obligations; to crimes and offenses and their punishments; to courts-martial; and to rank. The crimes and offenses referred to are those against divine worship, perjury, mutiny and insubordination, desertion and absence without leave; offenses in the field, camp, garrison, or quarters; drunkenness, disgraceful conduct, false returns, billets and carriages, recruiting and miscellaneous offenses. By the 3d article it is ordered that every recruit shall, within ninety-six hours, have the 40th and 46th articles read to him, and shall within ninety-six hours, but not sooner than twenty-four, make the following oath before some qualified authority: "*I do make oath, That I will be faithful and bear true allegiance to her majesty, her heirs and successors, and that I will, as in duty bound, honestly and faithfully defend her majesty, her heirs and successors, in person, crown, and dignity, against all enemies, and will observe and obey all orders of her majesty, her heirs and successors, and of the generals and officers set over me. So help me God.*" The 191st article is to the effect that whenever any forces shall have embarked on board ships of war or transports, the officers and soldiers shall, from the time of embarkation, strictly conform themselves to the laws and regulations established for the government and discipline of the ship; and shall consider themselves, for these purposes, under the command of the senior officer of the particular ship, as well as under the superior officer of the fleet (if any) to which such ship belongs. See A. of W. for the Marine Forces.

2. *A. of W. for the Marine Forces.* till 1879 made under the authority of another annual mutiny act, are now regulated by the army discipline act. Unlike the A. of W. for the army, they do not issue directly from the crown, but are made by the lord high admiral, or by the commissioners for executing that office, and they are authorized so to be made by the last-mentioned mutiny act. With this exception, they are much the same as the A. of W. for the army. They relate exclusively, however, to the marine forces *while on shore*, and this specialty is expressed in the preamble of the act, which recites that "the said forces may frequently be quartered, or be on shore, or sent to do duty, or be on board transport-ships, or merchant-ships, or vessels, or they may be under other circumstances in which they will not be subject to the laws relating to the government of her majesty's forces by sea." While doing duty in any of her majesty's ships or vessels in commission, the marines, like other naval forces, are subject to the A. of W. for the government of the navy.

*A. of W. for the Navy.*—In regard to such regulations, the navy is differently situated. It is not governed by any annual mutiny act, but the A. of W. relating to it are contained in the naval discipline act, 29 and 30 Vict. c. 109 (1866), which supplies the law of the sea-service. The naval A. of W. were eminently Draconian, but by the naval courts vastly mitigated in practice. The first naval A. of W. authorized by parliament were contained in the 13 Chas. II. c. 9, said to have been drawn up by admiral Montague, afterwards earl of Sandwich, with the approbation of lord chancellor Clarendon and other members of the privy council. But that statute and subsequent supplementary acts were repealed by the 22 Geo. II. c. 33, the forerunner of the later naval discipline act. See Mr. Prendergast's *Law of the Navy*, 1852, Part I. p. 15.

The mutiny act and the marine mutiny act, both now superseded by the above act of 1879, vested power to make articles of war in the crown and admiralty respectively. These were very voluminous, and often merely a repetition of the clauses of the mutiny act, while including others relating to lesser crimes and punishments than there mentioned, as also more details as to the constitution and procedure of courts-martial. The army discipline and regulation act has so far incorporated the mutiny acts and the articles published with them, that there seems but little necessity for further A. of W. to issue; while rules of procedure, issued by the crown, under the authority of the act, and concurred in by the admiralty, are now published with the act.

ARTICLES OF WAR (*ante*), the name given to the act of congress, approved April 10, 1806, establishing rules for the regulation of the U. S. army; and to the act of 1864, superseding that of 1802, for the government of the navy.

**ARTICLES, THE SIX**, often mentioned in the ecclesiastical history of England in the 16th c., were articles imposed by act of parliament in 1539, when Henry VIII. being displeased with some of the bishops most favorable to the reformation, their opponents for a time regained the ascendancy. These A. asserted the doctrine of transubstantiation, declared communion in both kinds not to be necessary, condemned the marriage of priests, enjoined the continued observance of vows of chastity, and sanctioned private masses and auricular confession. The act imposing them was popularly called "the six-stringed whip." Severe penalties were appointed for writing or speaking against them, and for abstaining from confession or the sacrament at the accustomed times, for priests failing to put away their wives, and for persons writing or speaking against the doctrine of transubstantiation. Archbishop Cranmer vainly opposed the act in the house of lords: the king was resolute to have it passed. Its severity was mitigated by a subsequent act of his reign (1544), and although it continued substantially unrepealed, it was transgressed with impunity even by ecclesiastical dignitaries.

**ARTICLES, THE THIRTY-NINE**, of the church of England, are the articles of religion which were agreed upon by the archbishops and bishops of both provinces and the whole clergy in the convocation held at London in the 4th year of Elizabeth, 1562, under archbishop Parker. To have a clear view of the history of these important articles, we must go back to the promulgation of the original ones, 42 in number, in the reign of Edward VI. The council appointed by the will of Henry VIII. to conduct the government during the king's minority, was for the most part favorably disposed towards the reformed opinions, and the management of church affairs devolved almost entirely upon archbishop Cranmer. In the year 1549, an act of parliament was passed, empowering the king to appoint a commission of 32 persons, to make ecclesiastical laws. Under this act, a commission of 8 bishops, 8 divines, 8 civilians, and 8 lawyers (amongst whom were Cranmer, Ridley, Hooper, Coverdale, Scory, Peter Martyr, Justice Hales, etc.) was appointed in 1551, and one of its first acts was to draw up a code of articles of faith. These were 42 in number, and were set forth by the king's authority in 1553. Strype and Burnet make it appear that these 42 articles were agreed upon in the convocation that was sitting in 1552, but this was not the case. Fuller, speaking in his quaint way of this convocation, declares that it had "no commission from the king to meddle with church business, and," he adds, "every convocation in itself is born deaf and dumb, so that it can neither hear nor speak concerning complaints in religion till first *Ephphatha*, 'Be thou opened,' be pronounced unto it by royal authority. However," he continues, "this barren convocation is entitled the parent of those 42 articles which are printed with this title, *Articuli de quibus in Synodo Londinensi 1552 A.D. inter Episcopos et alios convenerat*." To these articles was prefixed the catechism, and there is no doubt of Cranmer having had the principal hand in their composition; for he owned before queen Mary's commission that they were his doing. But immediately after their publication, Edward died, and one of the first acts of the convocation summoned with the parliament in the first year of queen Mary, was to declare that these 42 articles had not been set forth by the agreement of that house, and that they did not agree thereto. In 1558, Elizabeth succeeded her sister. In 1559, Parker was installed in the see of Canterbury, and immediately the other vacant sees were filled up. And now came a fresh opportunity of drawing up some articles of faith which might serve as a test of orthodoxy in the reformed church. Parker applied himself to this work, and, for the purpose, revised the 42 articles of king Edward, rejecting 4 of them entirely, and introducing 4 new ones, viz., the 5th, 12th, 29th, and 30th as they now stand, and altering more or less 17 others. This draft Parker laid before the convocation which met in 1562, where further alterations were made; and the 39th, 40th, and 42d of king Edward's, which treated of the resurrection, the intermediate state, and the doctrine of the final salvation of all men, were finally rejected. The 41st of king Edward's, which condemned the Millenarians, was one of the four which Parker omitted. Thus the articles were reduced to 39. They were drawn up and ratified in Latin, but when they were printed, as was done both in Latin and English, the 29th was omitted, and so the number was further reduced to 38. From these 38 there was a further omission, viz., of the first half of the 20th article, which declares that "the church hath power to decree rites and ceremonies, and hath authority in controversies of faith." As all the records of convocation perished in the great fire of 1666, it is very difficult to ascertain how these omissions arose. However, in 1571, the articles once more underwent revision. Archbishop Parker and bishop Jewel made a few trifling alterations, and the 29th being restored, the convocation which was then sitting ratified them both in Latin and English, and an act of parliament was passed in that year compelling the clergy to subscribe "such of them as only concern the confession of the true Christian faith, and the doctrine of the sacraments." There still, however, remained some difficulty as to which was the authorized copy, some of the copies being printed with, and others without, the disputed clause of the 20th; but this was finally settled by the canons passed in the convocation of 1604, which left the 39 articles as they now stand. "His majesty's declaration," which precedes them, and directs that they shall be interpreted "in their literal and grammatical sense," was prefixed by Charles I. in 1628.

It may be interesting to know from what other sources the 39 articles are derived.

Some of them, as the 1st, 2d, 25th, and 31st, agree not only in their doctrine, but in most of their wording, with the confession of Augsburg. The 9th and 16th are clearly due to the same source. Some of them, as the 19th, 20th, 25th, and 34th, resemble, both in doctrine and verbally, certain articles drawn up by a commission appointed by Henry VIII., and annotated by the king's own hand. The 11th article, on justification, is ascribed to Cranmer, but the latter part of it only existed in the articles of 1552. The 17th, on predestination, may be traced to the writings of Luther and Melancthon.

The 39 articles have been described as "containing a whole body of divinity." This can hardly be maintained. They contain, however, what the church of England holds to be a fair scriptural account of the leading doctrines of Christianity, together with a condemnation of what she considers to be the principal errors of the church of Rome, and of certain Protestant sects. As far as they go and there are many things unnoticed by them they are a legal definition of the doctrines of the church of England and Ireland; though it is to the *Book of Common Prayer* that members of that communion look for the genuine expression of their faith. They were adopted by the convocation of the Irish church in 1635, and by the Scotch Episcopal church at the close of the 18th century. Corpus Christi college, Cambridge, contains the only copies of the A. in manuscript or print that are of any authority. Amongst them are the Latin manuscript of the A. of 1562, and the English manuscript of the A. of 1571, each with the signatures of the archbishops and bishops who subscribed them. See *An Account of the Thirty-nine A.*, By Dr. Lamb.

For other "Articles," see LAMBETH, PERTH, and SCHMALKALD.

**ARTICULATA**, or **ARTICULATED ANIMALS**, one of the great primary divisions of the animal kingdom, according to the system of Cuvier, who in this is followed by recent naturalists generally. The term indicates not the possession of articulated members, but the articulated structure of the whole body. The A. are composed of segments articulated or jointed together in a line, each segment being formed of one or more rings, which in some appear externally as mere transverse folds in a soft skin, but are often covered with a hard substance similar in chemical composition to the bones of vertebrate animals. To this the muscles are attached, and it has sometimes received the name of an external skeleton—a name perhaps suggestive of closer and more numerous analogies to the bony framework of the vertebrate animals than actually exist. In some of the A. the rings are almost equally developed; in others, the difference is very great. They are divided into those which have and those which have not articulated members, the first subdivision including insects, arachnida, crustacea, and myriapoda; the latter, annelida and entozoa. Some naturalists rank cirrhopoda (barnacles, acorn-shells, etc.) among the A., and regard them as intermediate between these two subdivisions; others follow Cuvier in placing them among the mollusca. The rotifera (or wheel animalcules) are also placed by some in the second subdivision of the A., but their right to be so placed is by no means well established. It is in the first subdivision only that the rings are very distinctly grouped in what are called segments of the animal; and even in the myriapoda (centipedes, *juli*, etc.) they often seem little else than mere repetitions of each other; whilst in some of the crustacea, as the crabs, the trunk becoming encased in a hard envelope, the segments become immovably united, so that they no longer appear as distinct. A few only of the lowest A., however, are destitute of a distinct head, in which are placed the eyes and other organs of special senses, with regard to which there is considerable difference in the different classes. In it also they usually have jaws for seizing their food and cutting or tearing it to pieces. Their jaws do not open vertically, as in vertebrate animals, but laterally; and there are frequently several pairs of them. Some, however, have the mouth adapted merely for suction. The alimentary tube often proceeds in a straight line from one extremity of the body to the other; and when it is convoluted, its convolutions are usually few. There is no proper heart; but instead of it, we find a *dorsal vessel*, a tube carried along the central line of the body near the back or upper side, and divided in a manner corresponding with the division of the body into rings and segments; a general connection being thus maintained, whilst each segment or each ring has to a certain extent a system of circulation for itself. Respiration is effected either by gills (*branchiæ*), which is the case in those A. that live in water, or by air-tubes (*tracheæ*) and sacs; and the aëration of the blood taking place not merely in one or two, but in many of the rings, great muscular power and activity are maintained without a very active circulation. The muscular power is, indeed, greater in proportion to the size in the A. than in any other animals. The blood is usually white; in some of the annelida alone it is red; but this color (see **ANNELIDA**) does not indicate any approach to the higher classes of animals, although even Cuvier appears to have regarded it as a reason for assigning to the annelida the first place among the A. The nervous system exhibits a great similarity throughout the whole of the A., and corresponds in its general plan with their system of circulation. It consists of a series of small nervous masses or *ganglia*, arranged in a chain along the central line of the body on the under side of the animal. A ganglion in the head is often termed the brain, and from it proceed the optic nerves, and other nerves of the special senses; but it by no means perfectly corresponds to the brain in vertebrate

animals. There is usually a ganglion for each ring. The ganglia themselves are double or composed of two halves, more or less distinctly separated; the connecting cord also is double. In those A. which have articulated limbs, the ganglia are largest in the parts of the trunk with which the limbs are connected, whilst they almost disappear from the more unimportant rings; in the crabs, and some other tailless or very short tailed crustacea, they are condensed into two masses.

The remains of the A. in the fossiliferous rocks are numerous, although often so fragmentary and imperfect that the determination of genus and species is impossible, and their complex organization cannot be thoroughly investigated. It is evident, however, that many of them differed much from any animals now known to exist, and changes can be observed from one geologic period to another; the great crustacean family of the trilobites (q.v.), for example, being found only in the palaeozoic rocks. Markings, supposed to be the tracks and burrows of marine worms, appear among the earliest traces of animal life.

**ARTICULATE SOUNDS.** See LETTERS.

**ARTIFICIAL HORIZON,** a reflecting surface, usually of quicksilver in an open dish, useful in finding altitude when the natural horizon is indefinable, and in determining the zero for all instruments by which altitude is measured.

**ARTIFICIAL LIMBS.** With the exception of the celebrated artificial hand of the German knight, Götz von Berlichingen\*—who flourished in the early part of the 16th c. (1513), and who was named *The Iron-handed*—which weighed three pounds, was so constructed as to grasp a sword or lance, and was invented by a mechanic of Nuremberg, our knowledge of artificial limbs dates from the time of Ambrose Paré, whose *Œuvres de Chirurgie* were published in 1575. The twelfth chapter of that volume, as translated by Thomas Johnson in 1605, shows "by what means arms, legs, and hands may be made by art, and placed instead of the natural arms, legs, and hands that are cut off or lost." No improvements worthy of record were made from the time of Ambrose Paré to the beginning of the present century, when Baillif of Berlin constructed a hand which did not exceed a pound in weight, and in which the fingers, without the aid of the natural hand, not only exercised the movements of flexion and extension, but could be closed upon and retain light objects, such as a hat, and even a pen. "Artificial hands," says Mr. Heather Bigg, "are now constructed, by means of which a pin may be picked up from the ground, a glass raised to the lips, food carried to the mouth, and a sword drawn from its scabbard and held with considerable firmness; while a combined arm and hand is fabricated, which is equal to the ordinary requirements of histrionic declamation."—*Orthopraxy*, 1865, p. 157. The utility of an artificial arm depends much on the nature of the stump. A stump above the elbow is best suited for an arm when it gradually tapers to its lowest end, and terminates in a rounded surface. When an arm is removed at the shoulder-joint, and there is no stump, an artificial arm can still be fixed in its proper place by means of a corset. In amputation below the elbow-joint, the best stump is one which includes about two thirds of the forearm; while a stump formed by amputation at the wrist is very unsatisfactory. The simplest form of artificial arm intended to be attached to a stump terminating above the elbow, "consists of a leathern sheath accurately fitted to the upper part of the stump. The lower end of the sheath is furnished with a wooden block and metal screw-plate, to which can be attached a fork for holding meat, a knife for cutting food, or a hook for carrying a weight."—*Op. cit.* p. 160. The arm should be so carried as to represent the position of the natural arm when at rest. It is retained in its position by shoulder and breast straps, and forms a light, useful, and inexpensive substitute for the lost member. More complicated and therefore more expensive pieces of apparatus are made, in which motion is given to the fingers, a lateral action of the thumb is obtained, and the wrist-movements are partially imitated; and a degree of natural softness is given to the hand by a covering of gutta-percha and India-rubber. Such a hand, says Mr. Bigg, is often more symmetrical in aspect than the natural hand, but it possesses no efficient grasping power. Hence provision has to be made for attaching various instruments to its palm, such as special hooks, which can be removed at pleasure, for driving, shooting, etc.; apparatus for using the knife and the fork, for grasping the pen, etc.; indeed, the number and variety of instruments capable of being applied to an artificial hand are extremely great. Nothing has tended so much to the very highest development of artificial arms and hands, as an acci-

Nervous System of an  
Insect.

\*The iron hand of this knight, who has been immortalized by Goethe, is preserved at Jaxthausen, near Heilbronn, and a duplicate of it is in the Schloss at Erbach, in the Odenwald. It is stated in Scott's *Border Antiquities*, vol. ii., p. 206, that the family of Clephane of Carslogie "have been in possession from time immemorial of a hand made in the exact representation of that of a man, curiously formed of steel," which was conferred by one of the kings of Scotland on a laird of Carslogie, who had lost his hand in the service of his country.—See *Notes and Queries* for July 17, 1867, p. 35.

dent which happened more than a quarter of a century ago to the celebrated French tenor, M. Roger, who lost his right arm above the elbow. It was necessary for his future appearance on the stage, that he should have an artificial limb, which would serve the purposes of histrionic action, and permit him to grasp a sword and draw it from its scabbard. Such a contrivance was invented in 1845 by Van Petersen, a Prussian mechanic, and the French academy of sciences commissioned MM. Gambey, Rayer, Velpeau, and Magendie to report upon it. For a history of the nature of the limb, the reader is referred to the report which appeared in the *Comptes Rendus* for that date, or to Mr. Bigg's *Orthopraxy*, pp. 176-181. The apparatus, which weighs less than 18 oz., was tested upon a soldier who had lost both arms. By its aid he was enabled to pick up a pen, take hold of a leaf of paper, etc.; and the old man's joy during the experiment was so great, that the academy presented him with a pair of these arms. Van Petersen's conceptions have been extended and improved by Messrs. Charriere, the celebrated surgical mechanics of Paris, aided by M. Huguier, the well-known surgeon. A very marvelous arm has also been almost simultaneously constructed by M. Bechard, which, "by means of a single point of traction, placed in pronation, executes first the movement of supination, next in succession the extension of the fingers and abduction of the thumb: the hand is then wide open."—Bigg, *op. cit.* p. 190.

Artificial legs, having fewer requirements to perform than artificial arms, are comparatively simple in structure. We borrow the description of the ordinary bucket leg in common use amongst the poorer classes from Mr. Bigg's *Orthopraxy*. "It consists of a hollow sheath or bucket, accurately conformed to the shape of the stump, and having—in lieu of the more symmetric proportions of the artificial leg—a 'pin,' placed at its lower end to insure connection between it and the ground. This form of leg is strongly to be recommended when expense is an object, as it really fulfills all the conditions excepting external similitude embraced by a better piece of mechanism. It is likewise occasionally employed with benefit by those patients who, from lack of confidence, prefer learning the use of an artificial leg by first practicing with the commonest substitute." As, when the body rests on a single leg, the center of gravity passes through the tuberosity of the ischium, it is essential that the bucket should be so made as to have its sole point of bearing against this part of the pelvis.

Of the more complicated forms of artificial leg, three are especially popular. The first of these is of English origin, and, owing to its having been adopted by the late marquis of Anglesea, is known as the *Anglesea leg*. For a description of it the reader is referred to Gray's work on *Artificial Limbs*, one of the firm of Grays having been the constructor of the legs used by the marquis. This was for a long time the fashionable artificial leg. The second leg worthy of notice is that invented by an American named Palmer, and called the *Palmer leg*. From its lightness and the greater ease of walking with it, it has long superseded the Anglesea leg in America. In the third of these legs, also invented in America, and known as *Dr. Bly's leg*, the principal faults of the two other legs have been completely overcome. The advantages of this leg are thus summed up by Mr. Bigg, who has fully described and figured its mechanism: (1.) Adaptation to all amputations either above or below the knee. (2.) Rotation and lateral action of the ankle-joint. (3.) Power on the part of the patient to walk with ease on any surface, however irregular, as, owing to the motion of the ankle-joint, the sole of the foot readily accommodates itself to the unevenness of the ground, which is an advantage never before possessed by any artificial limb. (4.) The ankle-joint is rendered perfectly indestructible by ordinary wear, owing to its center being composed of a glass ball resting in a cup of vulcanite; thus it never gets out of repair, as the Anglesea leg but too frequently does, and the original cost is almost the only one the patient incurs. (5.) The action of the ankle-joint is created by five tendons, arranged in accordance with the position assigned to them in a natural leg. These tendons are capable of being rendered tight or loose in a few instants, so that the wearer of the leg has the power of adjusting with precision the exact degree of tension from which he finds the greatest comfort in walking, and also of giving the foot any position most pleasing to the eye. (6.) There is a self-acting spring in the knee-joint, urging the leg forward in walking, and imparting automatic motion, thus avoiding the least trouble to the patient, who finds the leg literally and not metaphorically walk by itself. (7.) The whole is covered by a beautiful flesh-colored enamel, thus avoiding the clumsy appearance of the wood, as is always found in an Anglesea leg, admitting of its being washed with soap and water like the human skin. (8.) At the knee-joint there is a mechanical arrangement representing the crucial ligaments, and affording natural action to that articulation by which all shock to the stump in walking is avoided. This leg is patented, and, as might be expected, is somewhat expensive.

In cases of arrested development of the lower limbs, short-legged persons may be made of the ordinary height by the use of two artificial feet placed twelve or more inches below the true feet, and attached to the legs by means of metallic rods, jointed at the knee and ankle.

Other parts not entitled to be called limbs, can also be replaced by mechanical art—such as the nose, lips, ears, palate, cheek, and eye. In the present advanced state of plastic surgery, deficiencies of the nose, lips, and palate can usually be remedied by an

operation; cases, however, may occur where an artificial organ is required. Artificial ears are molded of silver, painted the natural color, and fixed in their place by a spring over the vertex of the head. Loss of an eye causes sad disfigurement; but the artificial eyes of Boissonneau (see his *Renseignements Généraux sur les Yeux Artificiels, leur Adoption et leur Usage*), which have been shown in all the recent public exhibitions, completely throw all others in the shade, and cannot be detected without the closest inspection. For further details on all these subjects we must refer to Mr. Bigg's volume, which is a complete encyclopædia on these and allied topics.

ARTIGAS, JOSÉ, 1755-1851; a Montevidean officer and dictator. At an early age he went into service in Buenos Ayres in the insurrection against Spain, and won a number of victories. He then joined the republican army besieging the Brazilian troops occupying Montevideo, but he acted so independently that the director outlawed him. A. then organized a force of *guachos* (cattle-drivers), defeated the troops sent against him, and forced the junta to give him the whole of Uruguay, and recognize him as an independent chief. He drove the Portuguese out of Montevideo, became dictator, and in 1815 made an unsuccessful effort to take Buenos Ayres. He was defeated from time to time, and in 1820 fled to Paraguay; but the dictator there sent him to Candelaria, where he passed the remainder of his life in peace as a political exile.

**ARTILLERY.** The various meanings given to this word render it desirable that the reader should know under what headings in the *Encyclopædia* to look for information on the subject. Sometimes A. means large cannon or ordnance of every kind; sometimes it includes the shot and shell as well as the cannon; sometimes it applies to the soldiers, officers and men, who manage the large cannon in military battles and sieges; sometimes it designates the soldiers as well as the cannon, the *personnel* as well as the *matériel*. In the present work, the large pieces of ordnance, as a class, are described under **CANNON**; while the specialties of each kind will be found briefly noticed under such headings as **CARRONADE**, **HOWITZER**, **GUN**, **MORTAR**, **SHELL-GUN**, etc.; and in some cases under the names of the inventors, as **ARMSTRONG GUN**, **LANCASTER GUN**, etc. By this arrangement we shall be enabled to confine the word A. to such articles as relate more especially to the *personnel* of the service—the skilled soldiers who have to deal with large pieces of ordnance in land-warfare. It may, however, be well here to explain that the term *Equipment of A.* is applied to a combination of men, *matériel*, and horses, suitable for coast-defenses, sieges, or the arming of fortified posts. There are several kinds of equipments of *light A.*, under the names of horse, field, rocket, mountain, and reserve; and others of *heavy A.*, for the attack and defense of coasts and fortified places. These various equipments are generally divided into smaller collections called *batteries* (q.v.), for more easy control and maneuvering. Brief explanations will be found under nearly all the names here indicated. See **WAR-SERVICES**.

**ARTILLERY (ante).** The history of A. may be said to date from the discovery of gunpowder, which is popularly attributed to Roger Bacon and Barthold Schwarz, two monks of the 13th c., although a mixture of niter, charcoal, and sulphur, was used for explosive purposes by the Chinese during the 9th century. Its introduction into European warfare is due to the Moors, for mention is made of A. at Cordova in 1280. Ferdinand IV., of Castile, took Gibraltar with A. in 1309, and cannon were used at the sieges of Baza, Martos, and Alicante. This arm soon became known throughout Europe. The French availed themselves of it at the siege of Puy Guillaume in 1338, and the English had three small guns at the battle of Crécy in 1346. In the French war of independence against the English, A. was much used; and in 1428 Joan of Arc is said to have pointed the guns herself. The guns of the 14th c. were of the rudest design; in the 15th c. Charles VIII. of France used an improved A. in his Italian campaigns, and to this arm also Louis XII. largely owed his success in Italy. Henry VII. and Henry VIII. of England did much for its advancement. During the 16th c., brass guns and cast-iron projectiles were adopted throughout Europe, while Tartaglia in Italy made great improvements in gunnery, and invented the gunner's quadrant. During the latter part of this century case-shot, the German *hagelkugel*, was invented, and shells were fired from mortars. The first half of the 17th c. forms an era in the history of A. Henry IV. of France was among the first to recognize its coming importance, and occupied himself diligently with its improvement. Maurice and Henry Frederick of Nassau made much advancement in it, but it was under the great Swedish warrior, Gustavus Adolphus, that A. first began to take its true position on the battle-field. He attached two guns to each regiment, and may, therefore, be said to be the father of the battalion system of guns; he proved its utility in the celebrated thirty years' war. During his life he did much to forward the science of A., increasing its mobility and its rapidity of fire, and raising the proportion of guns to over 6 for 1000 men. In England the laboratory at Woolwich was established in 1672, and a reorganization of the A. took place in 1682 under the master-gen., Lord Dartmouth. Louis XIV. established a special A. force, raised in 1671 a regiment for A. duty, and in 1690 founded the first A. schools. The inventions of the elevating screw, the prolonge, and the priming tube filled with powder, were made during his reign. The Prussian A. was very backward during the first part of the 18th c., and Frederick the great did not at first place much value upon its services. Although it contributed much to Frederick's victory at Rossbach, it was

usually no match for the well-handled Austrian guns, which fact impressed him with the importance of giving more attention to this branch. He therefore raised the proportion of guns, and established horse A. in 1759. After the seven years' war the Austrians recognized the importance of the A. in modern warfare, and prince Lichtenstein was commissioned to reorganize it. The experience of Frederick's wars was best utilized by France, and under Gribeauval, in 1765, great reforms in the French A. were commenced. This officer had been sent to Austria during the seven years' war, and had held command under prince Lichtenstein. Struck with the improvements effected in Austria, he strove on his return to build up a complete system, as to both persons and material, making a separate provision for field, siege, garrison, and coast A. At first his reforms met great opposition, but in 1776 he became first inspector-general of A., and was able to carry through his improvements. The French horse A. dates from 1791, and the last step in the complete organization of the field A. was made in 1800, when the establishment of a driver corps of soldiers put an end to the old system of horsing by contract. Napoleon, who was a great A. officer, introduced the tactical combination with brilliant success. To his wars we first look for instances of the important effects produced by this arm in that concentration of fire, which in those days was produced only by massing guns. Napoleon III. made A. a special subject of study; and the great treatise upon it, commenced and mainly written by him, is a standard work on the subject. Since the war of 1870-71, in which the French A. proved itself far inferior to the German, the French have been actively engaged in experiments with a view to the introduction of superior guns, and have increased their force of A. by 120 batteries. Similar progress has been made by the other great European powers during this century. The British A. had greatly deteriorated during the 18th c., and was not up to the standard of other countries, but horse A. was formed in 1793, and a drivers' corps introduced the following year. At the commencement of the 19th c., the Prussian A. was powerful rather than mobile; but after the disasters of 1806-7 this defect was remedied, and in 1816 further improvement was made. In 1872 the German A. was reorganized, the field A. of each army corps being augmented to 17 batteries, and divided into two regiments. The Austrian A. has always been pre-eminent both in the excellence of its material and in tactical handling on the field. In 1859, rifled guns were introduced, and in 1861 gun-cotton was substituted for gunpowder, but was soon afterwards abandoned. Russia won special distinction in the Napoleonic wars by the power and good service of its A., and has continued to give great attention to this arm. Having adopted the breech-loading system of Prussia, Russia has increased its field A. from three to four batteries per division, with 38 batteries of mitrailleuses added.

Gen. William F. Barry was the organizer of the A. of the union armies during the rebellion. The aggregate of field-guns was about 15,000, with 40,000 horses and 48,000 men. The number of guns of position used in field-works or entrenched lines during that war was 1200, served by about 22,000 men. There are at present in the regular army of the United States, 5 regiments of A., with 284 officers and 2321 enlisted men. The personal armament of an artilleryman of the mounted batteries, whether field or siege, is a pistol and saber for the sergeants, trumpeters, and drivers; and a saber only for each cannoneer. Those serving in the sea-coast fortifications have a rifle-musket and the full equipment of an infantry soldier. The material of a mounted battery of the U. S. field A. when on a war-footing is 6 guns, 6 caissons, 1 battery-wagon, 1 traveling forge, and 112 horses; on a peace-footing it is 6 guns, 6 caissons, and 80 horses. The ammunition of a field-battery for active service in war is 400 rounds per gun. The organization of a siege-battery in the U. S. service is 4 guns, 1 battery-wagon, 1 traveling forge, and 60 horses. The ammunition for the siege-battery is 250 rounds per gun. The breech-loading principle was adopted in a clumsy way at the very outset of cannon construction. John Owen first cast brass cannon in England in 1535, and a year or two later they were manufactured in Scotland; but no long guns for firing hollow projectiles at long-range by direct fire were known until col. Bomford, of the U. S. ordnance department, invented a cannon in 1812 called a "columbiad," which proved very successful. Iron in some form is the sole metal in use for heavy artillery; cast iron is used for smooth-bore guns and for rifled guns in the United States. Palliser invented a gun with a steel interior tube, strengthened by an exterior casting of iron; and his system became very popular in England; but the inventions of Sir William Armstrong, improved by those of Fraser, proved far superior, and have been generally adopted. Russia, Germany, and other nations have adopted the Krupp system with heavy forgings of steel ingots.

The defense of war-ships with iron armor has caused an increase in the size, weight, and calibers of sea-coast and naval cannon, and the whole method of gun-construction has been altered. Armstrong was the first in England to see the necessity of a change, and his method was improved by Whitworth, Fraser, Palliser, Blakely, and others. Francis Krupp of Essen, Prussia, is the inventor of a new method which proved so successful, that it has been introduced in Germany, Russia, Austria, Belgium, and Spain. The body of the gun is fabricated from a solid ingot of low steel worked under heavy steel hammers, and is strengthened by three or more steel tubes, shrunk upon the central tube of the gun, the last ring, or tube inclosing the breech, being forged in one piece with the trunnions, without a weld. The rings have various lengths, and the gun is diminished in thickness towards the muzzle, not by tapering, but by being turned

with concentric steps of diminished heights. Krupp makes all his projectiles and gun-carriages of steel. In the United States, Rodman, Dahlgren, and Parrott have devoted themselves to the art of gun-construction. The Rodman gun is of cast iron; it is cast hollow and cooled from the inside, the exterior being in the mean time kept from rapid cooling by fires built around the gun in the casting-pit. The Dahlgren gun is of iron cast solid, and cooled from the exterior, very thick at the breech up to the trunnions, then diminishing in thickness to the muzzle. The Parrott gun, like the Rodman, is of cast iron, cast hollow, cooled from the inside, and strengthened about the chamber by an exterior tube of wrought-iron bars spirally coiled and shrunk on. It has been suggested that a Rodman gun lined with wrought iron on Palliser's system would prove a highly effective weapon. See BREECH-LOADING ARMS and NEEDLE-GUNS, *ante*.

**ARTILLERY COMPANY, HONORABLE**, is the oldest existing volunteer corps in Britain. Four military bodies—the A. C., the *Sergeant-at-Arms*, the *Yeomen of the Guard*, and the *Gentlemen Pensioners*, were established as far back as the time of the Tudors; they all still exist, but under greatly altered circumstances. In 1537, Henry VIII. granted a patent to three persons, appointing them "overseers of the science of artillery," for long-bows, cross-bows, and hand-guns. They were to constitute a guild or fraternity for this purpose, with power to appoint assistants and successors, to purchase lands, and to use a common seal; and their formal official name became "The Masters, Rulers, and Commonalty of the Fraternity or Guild of Artillery of Long-bows, Cross-bows, and Hand-guns." The freemen of the guild or company were empowered to keep arms, and to exercise themselves in shooting. In 1605 a patent was granted by James I., intended chiefly to effect the preservation of the shooting and practising grounds around London, for the A. C. In 1633 a commission was appointed by Charles I., still further to insure this object. In 1638 the corporation of the city of London presented to the company the plot of ground ever since called the artillery ground, near Moorfields, as a field for military exercise. Royal princes frequently enrolled themselves as members of the company, usually as "captain-general." In 1719, George I. issued an order that all commission and staff officers of the city train-bands (a metropolitan militia) should become members of the A. C., and exercise with the other members at all convenient times. The word "artillery" had heretofore been considered as applying to bows and arrows as well as to firearms; but the members of the company, like other marksmen, had almost abandoned archery, without, however, making any change in their designation. In a summons to the company to meet for exercise on a particular day in 1682, it is said: "Those gentlemen that on that day handle muskets are desired to take care that their arms are clean and well fixed, and that they bring with them fine dry powder, and even match." The company, like many other city guilds, has nearly outlived its original purpose. In 1780, when the "Lord George Gordon riots" afflicted the metropolis, the members of the A. C. effectually protected the bank of England; in 1848, when Chartist riots were apprehended, the company was on the alert to render good service if needed; and in the spring of 1859, when an uneasy feeling prevailed in England concerning the designs of France, the members polished their arms and looked forward to eventualities; but the company has never been engaged in actual warfare with an enemy.

The A. C. consists of members elected by ballot, who pay one guinea annual subscription, and supply themselves with dress, arms, and accouterments. These payments, together with the rental received from a small amount of real property, constitute the fund out of which the expenses are defrayed. The members learn rifle-shooting as well as artillery practice; there are certain days of meeting at Moorfields; and every summer there are certain days of drill and practice at Seaford. The corps comprises six infantry companies, a grenadier company, a light-infantry company, a rifle company, and an artillery company. Until 1849, the members elected their own officers; but since that year the crown has appointed them on the nomination of the lieutenantancy of the city of London. The lieutenant-colonel appoints the non-commissioned officers.

**ARTILLERY COMPANY, THE ANCIENT AND HONORABLE**, of Boston, the first regularly organized military company in America, formed in 1637, and copied from the Honorable Artillery Company of London, dating from 1537. The Boston company was chartered June, 1638, has always been vigorously sustained, and is noted for the eminent citizens in its membership. It has an annual parade, sermon, and dinner, formal and dignified. Charles W. Wilder is the present captain (1879). A third and elaborately illustrated history of the company is in preparation.

**ARTILLERY CORPS.** Referring to CANNON for a history of large pieces of ordnance, we here treat of the organization of the artillery service.

The larger weapons, before the invention of gunpowder, were sometimes called *engines of war*, sometimes *artillery*, and were worked by strong and rough soldiers, who needed no particular apprenticeship to that art. When, however, large balls of iron came to be propelled by the irresistible force of gunpowder, a great revolution gradually took place, though garrison-guns and siege-guns were improved more rapidly than field-guns. Nevertheless, field-guns changed the whole aspect of military tactics; for it became necessary that an army should form in order of battle at a much greater distance from the enemy than in older times. And when the cannon were made more rapidly

movable, so did tactics vary. Gradually, a body of men were set apart to study the force and action of gunpowder, the flight and range of projectiles, the weight and strength of cannon, and the maneuvering of heavy masses. The French were the first to make these researches; after them, the English; and still later, the Germans. During the thirty years' war, an important step was taken in Germany—that of including the artillerymen, who were till then a sort of guild, as a component in the regular army. Gustavus Adolphus in Sweden, Frederick II. in Prussia, and Napoleon I. in France, all attached a very high degree of importance to the artillery as an arm of the service. After the great wars in the beginning of the present century, nearly all the states of Europe formally recognized the artillery as the third great branch of military service (next after the infantry and cavalry); indeed, in almost all present armies, it takes practically the first place.

A. C., or artillerymen, are divided into land-artillery and marine-artillery. The land-artillery is divided into field, coast, garrison, and siege artillery. The field-artillery is subdivided into horse and foot. There are also the special appellation of reserve, light, and heavy artillery. In most European states, the artillerymen are divided into regiments, battalions, brigades, and companies; but in Britain the whole form one enormous regiment, which is expanded or contracted according to the exigencies of the service. See ARTILLERY, ROYAL REGIMENT OF. When military men speak of the field-artillery, they usually include cannon, carriages, horses, ammunition, and stores of every description, as well as the artillerymen. The distinction between heavy and light artillery depends on the size of the cannon, and the weight of the shot and shell propelled from them. For obvious reasons the construction of very large field-guns is avoided. Military men are not quite agreed as to the precise figures; but there was in the time of Napoleon I. a general concurrence in opinion that a well-appointed field-force should have two or three artillery guns to every 1000 infantry, and five or six horse-artillery guns to every 1000 cavalry. The proportion is necessarily affected by the kind of country and the amount of available transport. During the Peninsular war, Wellington had seldom more than 1 gun to every 1000 soldiers; when he entered France, he had 3 to the 1000. Napoleon preferred 2 per 1000, with a larger supply of ammunition than had before been deemed necessary; and many foreign governments followed his example. Since the Franco-German war, it is held that there should be always with the army 3 guns per 1000 infantry.

**ARTILLERYMAN.** See ARTILLERY CORPS; ARTILLERY, ROYAL REGIMENT OF.

**ARTILLERY, PARK OF,** is a collective name given to the whole of the guns, carriages, ammunition, and other appurtenances essential to the working of siege or field A. Besides reserve guns and carriages, there belong to it the ammunition wagons, as well for the infantry and cavalry as for the A., the implements and materials necessary for repairing and completing equipments, harness-stores, field-forges, laboratories, and (in some armies) transport and provision wagons. The *personnel* of a park of A. consists of A. officers, non-commissioned officers, and artillerymen; besides a large number of smiths, wheelwrights, saddlers, armorers, drivers, and other mechanics and laborers. Sometimes the term is applied to the place selected, as well as to the vast military stores collected there. During a siege, the park of A. is stationed out of reach of the enemy's fire, but in communication with the besiegers' trenches. If possible, its locality is chosen close to some good line of communication, either road or river. All pioneering or intrenching tools, and all handicraft implements, are arranged in rows nearest to the field of action, with requisite spaces for the convenience of the storekeepers and workmen. Behind these are the materials for erecting batteries, making fascines and gabions, and filling sand-bags. Furthest removed from the enemy are the magazines, in and near which shot and shell and other kinds of ammunition are stored. A large park of A. is usually divided into park-columns, for the sake of better supervision. Under some circumstances, the engineering park is distinct from the park of A., especially where these two arms of the service are so mutually independent as in the British army.

**ARTILLERY, ROYAL REGIMENT OF,** is the collective name for the whole of the A. belonging to the British army. Under ARTILLERY CORPS, the origin of similar bodies on the continent of Europe is briefly noticed. There was no regular regiment or corps of A. soldiers in the English army till the time of queen Anne, when the present royal regiment was formed. Since that period, from some anomaly which is not easily explained, all the additions have been made to the same regiment, instead of forming new regiments, to be combined into a division or corps. The regiment is now almost an army in itself; and to increase the anomaly, it comprises horse as well as foot. The foot-A., with medium guns, attend infantry in the battle-field; and with heavier guns, besiege and defend fortified places; while the horse-A., with lighter guns, accompany the cavalry. The mounted artillerymen were organized into a body long after those who maneuver on foot. Though both corps form one regiment; they have distinct designations—the *Royal A.*, and the *Royal Horse-A.* Besides these two corps, the regiment is considered to include the *Master Gunners* and the *Coast Brigade*.

The regiment has varied from 18,000 to 36,000 strong (including those placed upon the East India establishment), during the last 20 years. Formerly, the foot were divided into *battalions*, and the horse into *troops*. Each company, with its quota of guns and

stores, constituted a *field-battery*; and each troop, with its quota, constituted a *horse-battery*. The terms "company" and "troop" are now altogether abandoned as being properly applicable to infantry and cavalry, and both foot and horse are divided into *brigades* and *batteries*. Under the old organization, there was no major among the working officers, the designations being captain, second-captain, and lieutenants. The grades now are major, captain, and three lieutenants per battery. A battalion in former times usually comprised 8 companies. When the number of the regiment was 18,000, it comprised 119 companies and troops, averaging somewhat over 150 men each; at other times, the companies varied from 130 to 200 men each. At present, a brigade usually comprises 8 batteries of horse, or 10 of field, or 7 of garrison artillery. A horse-battery has 5 officers and 151 men; a field-battery (at home), 5 officers and 152 men; and a garrison-battery, 4 officers and from 100 to 150 men, according to the guns of position in its charge. The brigades of foot-A. are designated by ordinal numbers; the brigades of horse-A. are designated by letters, from A to F (omitting E). In the old nomenclature, the companies and battalions of foot-A. had numbers—i.e., 6th company, 12th battalion; and the troops of horse-A. were designated by letters.

The army estimates for 1878-1879 will afford correct information concerning the state of the royal artillery:

## ROYAL ARTILLERY.

Commissioned officers.....	1,193
Non-commissioned officers.....	2,874
Rank and file.....	25,603
Horses.....	8750

## ROYAL HORSE ARTILLERY.

Commissioned officers.....	236
Non-commissioned officers.....	361
Rank and file.....	5,320
Total men.....	35,587
Horses.....	4,600
Total horses.....	13,350

Of this number of men 11,928 are placed at the disposal of the East Indies, to be paid for out of Indian revenues.

The internal organization of the royal A., and the relation between the men and the guns which they serve, as well as some specialties of the several kinds of service, will be described under BATTERY. See also the article WAR-SERVICES.

**ARTILLERY, SCHOOLS OF.** The first school for A. instruction was established by the Venetians in the beginning of the 16th century. Soon afterwards, Charles V. established similar schools at Burgos and in Sicily. The French founded a school of practical A. in 1675; and in 1679, they added to it a theoretical school at Douai. At present, France has no fewer than seven such establishments. Saxony had an A. school in 1766; but the other German states were more tardy in this work. In Prussia, the artillery and engineer schools are combined; but in most of the European states, a separation between these two arms of the science is made. In most schools of A., the officers' studies comprise mathematics, as much of physics and chemistry as is necessary to the duties of the artillerist, field and permanent fortification, garrison-warfare, field-tactics, military history and topography, military surveying and sketching, drawing from the model, etc. The practical exercises include the serving and firing of guns and mortars, the laying out and constructing of field-batteries, and the operations of the laboratory and A. workshop.

The head-quarters for A. instruction in England are at Woolwich. A *royal military academy* was established there in 1741, to impart professional instruction to the artillerists and engineers belonging to the royal army. The East India Company sent their A. cadets to this academy from the year 1798 to 1810; but afterwards, until 1861, they maintained a separate establishment at Addiscombe (which, however, was not wholly for artillery). At the present day, the students in the academy are recruited by fair open competition. They enter between the ages of seventeen and twenty; and they remain two years, or such longer time as may fit them to pass an examination for the royal A. or engineers. The sons of military officers are admitted on lower terms than those of other persons. The financial control is under the secretary of state for war; but the commander-in-chief regulates the discipline and internal arrangements. There are 22 professors and instructors of various kinds. Besides this royal military academy, there is at Woolwich a *department of A. studies*, for the instruction of junior officers of A. and for facilitating their visits to the fortifications and public works of foreign countries. There is also a *select committee*, whose duties are not so much educational as experimental; it is a small establishment for examining and reporting on the numerous inventions relating to artillery, brought before the war office. The school of gunnery at *Shoebury Ness*, subordinate to the head-quarters of the A. at Woolwich, is for experiments

upon ordnance, gunpowder, and projectiles, and to exercise young A. officers in the practical and mechanical duties of their profession.

**ARTILLERY, SCHOOLS OF** (*ante*). One was established in the United States in 1823 at Fortress Monroe, but discontinued six years later. Another school was started in 1853, but was stopped when the war began in 1861. Near the close of 1867 it was again established. It is commanded by a colonel of artillery, assisted by a lieutenant-colonel and a major. Instruction is both theoretical and practical; and each of the artillery regiments in the regular army has one foot-battery at the school, the officers of the several batteries being the instructors. The term of instruction is one year.

**ARTIODACTYLES**, even-toed, herbivorous animals, a division of the *ungulata*, or hoofed; as the cow, sheep, camel, etc.; and some omnivora; as the hog.

**ARTOCARPACEÆ**, a natural order of dicotyledonous plants, of which the bread-fruit (*artocarpus incisa*) is the type; very nearly allied to that of *moraceæ* (mulberries, figs, etc.), and, like it, by many botanists regarded as a sub-order of *urticaceæ* (nettles, etc.). The botanical distinction between artocarpaceæ and moraceæ lies chiefly in the straight embryo and large cotyledons of the former. The fruit is often a *sorosis* (a single succulent fruit formed of the aggregated germens of a whole spike of flowers), as in the case of the bread-fruit (q.v.). There are upwards of 50 known species, natives exclusively of the tropics. The milky juice of some yields caoutchouc (q.v.); and that of a few species is so bland as to be used as a substitute for milk (see COWTREE). The juice of others is, however, very poisonous, as that of *antiaris toxicaria* the Antjar poison, one of the poisons called upas by the Javanese. The seeds are always wholesome; and those of the *musunga* of the Gold coast of Africa, and of *brosimum alicastrum* in the West Indies, are eaten as nuts. The fibrous bark of the bread-fruit tree is made into cloth in the South Sea islands, and that of other species of *artocarpus* is capable of being used in the same way. The bark of *antiaris* or *lepurandra saccidora* is used in western India for making sacks, which are formed by cutting a branch of the dimensions of the sack wanted; and simply turning back and drawing off the bark after it has been soaked and beaten, the wood being sawn off so as to leave a little portion to form the bottom of the sack. The fibrous bark of *cecropia peltata*, or trumpetwood, is used for cordage in tropical America. The stem and branches are very hollow, and are used for wind-instruments. The wood of some species is valuable, as that of the *brosimum* or *piratinera guianensis*, the snake-wood of Demerara.

**ARTOIS** was formerly a province of France, bounded by Flanders and Picardy, and almost corresponding with the modern department of *Pas-de-Calais* (q.v.). The capital of A. was Arras. Louis IX., in 1239, made A. a county, and gave it to his brother Robert, who was succeeded by his son, Robert II., surnamed Posthumous, who died in 1302. Afterwards it passed into the hands of Flanders and Burgundy, but was ceded to France by treaties in 1659 and 1678. Charles X., in his early life, and also after his abdication, was known by the title of count d'Artois.

**ARTS, DEGREES IN.** The term "A." or "liberal A.," as technically applied to certain studies, came into use during the middle ages, and on the establishment of universities, the term "faculty of A." denoted those who devoted themselves to science and philosophy, as distinguished from the faculty of theology, and afterwards of medicine and law. The number of "A." embraced in the full medieval course of learning was seven: grammar, logic, rhetoric (constituting the *trivium*), music, arithmetic, geometry, and rhetoric (the *quadrivium*). The terms master and doctor were originally applied synonymously to any person engaged in teaching. In process of time, the one was restricted to the liberal A. the other to divinity, law, and medicine. When regulations were established to prevent unqualified persons from teaching, and an initiatory stage of discipline was prescribed, these terms became significant of a certain rank, and of the possession of certain powers, and were called *gradus*, "steps" or "degrees." The passing of the initiatory stage, said to have been first instituted by Gregory IX. (1227-41), conferred the title of *bachelor* (q.v.), and an additional course of discipline and examination was necessary to obtaining that of *master*. The title of master of A. originally implied the right, and even the duty of publicly teaching some of the branches included in the faculty of A.; a custom which is still retained, to some extent, in the German universities, but has fallen into disuse in Britain and France, where the title is merely honorary. The subject will be more fully considered under the general head of DEGREE.

**ART UNIONS.** These institutions, which have for their object the promotion of a livelier interest in, and more liberal patronage of, the fine arts on the part of the general public, have gone far in modern times to supply the place of that encouragement which, at an earlier period, they received from princes and prelates.

The origin of A. U., though claimed by the Germans, seems really to belong to the French, and to be traceable to the stirring days of the first Napoleon. From France they passed over into Belgium, where they at once took root, and established themselves even in the less important towns, ten years before they were introduced into Germany. The A. U. of Malines dates from 1812, which is eleven years anterior to that of Munich. But it was in Germany that the importance of the results which A. U. were capable of

producing first became apparent, and it was from Germany that they were carried into England. The A. U. (*Kunstverein*) of Munich was established in 1823, and became the model of most of those which afterwards arose. The example of Munich was speedily followed (at the suggestion, we believe, of no less distinguished a personage than Alexander von Humboldt) by Berlin, and shortly thereafter by Dresden, Leipsic, Breslau, Halberstadt, etc.; and in less than ten years there were few of the larger towns of Germany in which A. U. were not to be found. But the most important of all the A. U. of Germany is that which was established at Düsseldorf in 1829, for the Rhine provinces and Westphalia. The Düsseldorf association has aimed at higher objects than A. U. have usually had in view, either in Germany or in England, and has been instrumental in promoting the execution of monumental works of art of the highest class. In the space of 20 years from its institution (1849), it had expended on works of art what in Germany was regarded as the enormous sum of 268,000 thalers, equivalent to about £40,200 sterling; and had been the means of placing 24 altar-pieces in churches, 11 paintings on a large scale in public buildings, of which the frescos in the council chambers at Elberfeld and at Aix-la-Chapelle may be mentioned as examples. The association at Düsseldorf also publishes an artistic periodical (*Correspondenzblatt*). Other associations have imitated, not without success, the association of Düsseldorf in directing their attention to the promotion of great works. The Bohemian association at Prague has been peculiarly meritorious in this respect; and those of Berlin and of Cologne deserve the highest commendation for the zeal with which the first promoted the erection of Kiss's magnificent group of the Amazon on the steps of the museum at Berlin, and the second urged on the completion of what already, in its still unfinished condition, is one of the greatest architectural monuments of northern Europe—the cathedral of Cologne. The establishment of permanent galleries of art in the cities to which they respectively belong, is also regarded in Germany as one of the higher objects of A. U.; and in this they have been recently followed in this country, as, for example, in Edinburgh. In Munich there is already a very noble collection of modern works of art, which have been brought together in this manner; and another of the same description is in course of formation in Berlin. Association galleries also exist in Dresden, Leipsic, Breslau, Stettin, etc. Groups of associations have also been formed in Germany for the promotion and encouragement of extensive works. The western group, or cycle, as it is called, includes Hanover, Halberstadt, Magdeburg, Halle, Gotha, Brunswick, and Cassel; the eastern, Danzig, Königsberg, Stettin, etc. This arrangement, by which the influence of these associations on the highest class of art must be vastly augmented, seems worthy of imitation in this country.

Scotland, as is not unusual where the suggestion comes from a continental source, preceded England in the establishment of A. U.; the first that was formed in Britain being that of Edinburgh in 1834. The cause of its introduction was not so much the hope of bettering the condition, as the necessity of preventing the utter extinction of everything beyond mere imitative art. Portrait-painting continued to furnish the means of living to those who practiced it with success; and those who represented familiar occupations or popular customs, obtained a more limited encouragement; but it was found that precisely as the artist rose in the scale of artistic endeavor, and tended in the direction of ideal art, the sympathy and interest of his countrymen, and consequently his own remuneration, declined. The royal academy of London, and the academies which had been formed after the same model in Edinburgh and in Dublin, notwithstanding the annual exhibitions which they had instituted, had entirely failed to remove this evil. Private purchasers were not to be found; and in Edinburgh it was calculated that never more than £300, and sometimes as little as £35, were expended in the purchase of pictures exhibited by the academy, and even these insignificant sums were usually paid for pictures of the very lowest class. Elsewhere, matters were even worse. Mr. Cash, a witness examined before the select committee of the house of commons on A. U. in 1845, stated that previous to the establishment of the art union in Dublin, "in 4 years, during the exhibition of the works of the royal Hibernian academy, 30s. only were expended on the patronage of 'art.'" "Thirty shillings annually?" asked the chairman. "No," replied the witness; "thirty shillings was the entire sum expended in the four years." The success of the Scottish association was immediate; and to its founders the public are in no small degree indebted for the rapid progress which art has made in this country during the last 20 years. "A large annual fund," says the secretary, in his statement to the above-named committee, "exclusively devoted to the purchase of paintings and sculpture, and to the dissemination of engravings, was speedily realized, which in the course of 9 years amounted to not less than £36,900. During the same period, 771 paintings, 40 pieces of sculpture, and about 30,000 impressions from engraved plates, were distributed among the members of the association." Since this period, the annual funds of the Edinburgh association have continued steadily to increase; and its promoters, as the results of their disinterested labors, have had the satisfaction to see a school of art spring up around them which is probably second to those of Munich and Düsseldorf alone. Our limits preclude us from entering into the history of the other societies in Britain which have been formed after the model of the parent institution of Edinburgh; but some conception of the success which has attended them may be gathered from the fact, that in 1856 it was calculated that they had expended not less

than the enormous sum of a million sterling on the encouragement of art. In addition to this direct expenditure, what is a very remarkable, and was to most persons probably an unexpected result, was, that the patronage of private individuals, in place of diminishing, greatly increased, both in Edinburgh and London, during the period in question. Before concluding our sketch of the rise of these very remarkable institutions, it is proper to mention the A. U. of New York, established in 1838, which now supports two galleries with works of art in that city, and the members of which have had the wisdom to establish an intimate relation and lively interchange of works between their own institution and that of Düsseldorf.

As regards the constitution of A. U., the following arrangements may be stated to be common to them all. Each member, in return for an annual contribution (in Britain, usually a guinea), receives an acknowledgment, which acts as his ticket in the lottery by which the works of art, purchased with the sum thus contributed, are distributed amongst the members. Generally, a fixed proportion of the contributions is retained and devoted to the preparation of an engraving, which is presented to those who have drawn blanks in the lottery. The engraving is usually executed by a local engraver, after a work of the local school intended to be patronized. The association further makes provision for an exhibition, either permanent, as at Munich, or annual, as in London and Edinburgh, consisting mainly of the works of local artists, though most associations now admit those of strangers. A diversity of practice has existed as to the mode of distributing the funds of the unions, and much controversy has taken place between their respective partisans. The first, common on the continent, and adopted in Edinburgh, consists in putting the whole sum collected for each year into the hands of a committee of gentlemen, who are chosen for their supposed æsthetic acquirements and impartiality, and requesting them to select the pictures and other works of art afterwards to be distributed to the subscribers by lot; the second is the London plan of distributing the money itself by lot, and then permitting, or rather compelling, the prize-holders to expend it on the pictures exhibited, the selection of the pictures, however, being left to their own taste and judgment. If the object of these institutions be to cultivate an artistic taste *higher* than that which exists in the general community for the time being, the advantages of the first over the second of these modes of distribution seem scarcely to admit of question. The subject was eagerly canvassed before the select committee, and their report was that the constitution of the Edinburgh association was preferable to that of the London union. The principal of the A. U., under some modifications, has been extended to the patronage of art manufactures. The difficulty in distinguishing between the lottery as part of the art union and lotteries of an unquestionably illegal kind led in 1846 to the passage of a special act for legalizing *bond-fide* A. U. maintained solely for the encouragement of art. See EXHIBITIONS.

**ARTVIN**, a t. of Asiatic Turkey, in the vilayet of Trebizond, 100 m. e. from the t. of Trebizond. The inhabitants, about 6500 in number, mostly belong to the Roman Catholic church.

**A'RUM**, a genus of monocotyledonous plants, belonging to the natural order *araceæ* or *aroidææ*. This order consists of herbaceous plants, some of which are stemless, and shrubby plants, some of which are arborescent, and some climb by aerial roots, clinging to the trees of tropical forests. The leaves are sheathing at the base, convolute in bud, usually with branching veins. The flowers are male and female, naked, arranged upon a *spadix*, which is generally inclosed in a *spathe* (q. v.); the male flowers at the upper part of the spadix, and the female flowers at its base. The stamens are definite or indefinite in numbers; the anthers sessile, or nearly so, and turned outwards. The ovary is free, generally one-celled, many-seeded; the stigma sessile. The fruit is succulent, the seeds pulpy, the embryo in the axis of fleshy or mealy albumen, with a lateral cleft in which the plumule lies; the albumen, however, is wanting in some plants of the order.—As thus defined, this order contains almost 200 known species, natives chiefly of tropical countries, but some of the herbaceous kinds belong to colder climates.—The limits of the order are, however, sometimes extended, so that it includes as sub-orders *typhaceæ*, *pistiaceæ*, etc.—The genus *A.* has a convolute spathe; the spadix naked at the point. In some species, a stench like that of carrion is produced during flowering, as well as a remarkable heat. Flowers, in general, are slightly warmer than the air around them, the heat being produced by the union of oxygen with some starch-like ingredient in the sap of the petals, or other parts of the flower; for flowers, instead of absorbing carbonic acid gas and giving off oxygen in the sunshine, like the leaves of plants, absorb oxygen and give off carbonic acid, like the lungs of animals. But flowers, in general, are only one degree, or one degree and a half, warmer than the air, whereas the flowers of some of the arums and nearly allied plants are sensibly warm to the touch, and that of *A. cordifolium* has been found to have a heat of 121° F., while that of the air was only 66° F.—The only British species is *A. maculatum*, CUCKOW-PINT or WAKE-ROBIN, which is abundant in England and in most parts of Europe, growing chiefly in moist shady woods and under hedges. It has a tuberous perennial root; its leaves are all radical, on long stalks, strongly arrow-shaped, often spotted; the spathe greenish yellow, inclosing a rather short violet or brownish red spadix. It produces scarlet berries, 1 or 2 seeded, about the size of peas, clustered upon the spadix. The root has a burning acrid taste, which,

however, it loses in drying or boiling. In a fresh state, it is a drastic purgative, too violent for medicinal use; and, indeed, it, as well as the leaves, is an active poison; yet a nourishing farina is prepared from it, after the acrid juice has been removed. This farina is a pure starch, and is known in England by the name of Portland sago or Portland arrow-root. It was formerly prepared to a considerable extent in the isle of Portland, where also the tubers (corms) themselves are eaten by the country people. A cosmetic, called cypress powder, is made from them in France, and they are used in Switzerland as a substitute for soap. They contain, indeed, a quantity of *saponine*, to which their acidity is supposed to be owing. They lose great part of their acidity in drying, and were formerly used in medicine as a stimulant in impaired digestion, a diuretic in dropsies, and an expectorant in chest complaints. The plant is extensively cultivated in India for food.—*A. indicum* is also much cultivated in Bengal for its esculent stems and small pendulous tubers.—Acridity in the juice, and the presence of an amylaceous substance of very nutritious quality, from which the acrid juice is easily separated, are characteristics of many plants of this order, particularly species of *caladium* and *colocasia*, much used for food in warm countries, under the names *cocco* (q.v.), *EDDOES*, etc.—*Amorphophallus campanulatus* (*A. campanulatum*), called *OL* by the Bengalese, is very much cultivated in some parts of India for its roots (flat underground corms), which form a very important article of food; yet in a fresh state it is so acrid that it is employed as an external stimulant, and is also used as an emmenagogue. Other species of *amorphophallus* are still more powerfully stimulant.—Two large species of *arisaema*, another genus very closely allied to *A.*, were found by Dr. Hooker to afford food to the inhabitants of the Sikkim Himalaya at an elevation of upwards of 10,000 ft. Their tuberous roots are bruised by means of wooden pestles, and thrown into small pits with water, until the commencement of acetous fermentation, when the acridity is mostly dissipated; but the process is so imperfect, that cases of injury from the poisonous juice are frequent. The tubers of *arisaema atrorubens* (*A. triphyllum* of Linnæus), a native of the United States, and there known as dragon-root and Indian turnip, yield a pure white starch like that of *A. maculatum*. Their medicinal uses are also similar; they are employed as a stimulant of the secretions.—The DRAGON-PLANT, *A. dracunculus*, a native of the south of Europe, is not uncommon in gardens in Britain, although it has a carrion-like smell, and its emanations are apt to produce headache and other disagreeable effects. It has a singular appearance—straight stalks, 3 ft. high, curiously spotted like the belly of a snake.—The peculiar acridity of the *araceæ* is most remarkably displayed in the dumb cane (q.v.).

**ARUN**, a river rising in St. Leonard's forest, in the middle of north Sussex, and after a course of 35 m., falling into the English channel. A canal unites it with the Wey, a feeder of the Thames.

**ARUNDEL**, a small t. 5 m. inland from the mouth of the Arun, in a tertiary and chalk district, on the s. side of the South Downs, in the s.w. of Sussex. It consists mainly of a very steep street rising from the right bank of the Arun to the summit of a hill crowned by a castle. The Arun is navigable for vessels of 150 tons up to the town. Bark and timber are the chief exports. Pop. in '71, 2956. A. was disfranchised by the reform bill of 1867. It is governed by a mayor, 4 aldermen, and 12 councilors. The castle, from its site, is a striking object, and was built soon after the Norman conquest. It is an oblong, including  $\frac{3}{4}$  acres within its walls. It was laid in ruins during the civil wars of Charles I., but, being the baronial residence of the dukes of Norfolk, the late duke restored it to its former Gothic magnificence. The keep, containing the dungeon, is a circular Norman tower of imposing strength.

**ARUNDEL**, THOMAS, archbishop of Canterbury in the reigns of Richard II., Henry IV., and Henry V., b. in 1353, was the second son of Robert Fitz-Alan, earl of Arundel and Warren. He was first archdeacon of Taunton, and at the early age of 21, he was, by the pope's appointment, consecrated bishop of Ely. In 1388, he was, by the same authority, transferred to the archiepiscopal see of York. He was also for some years lord high chancellor of England. Having been banished the kingdom for taking a leading part in the first attempt which was made to deliver the nation from the oppression of Richard II., he was honorably received at Rome, and by pope Boniface IX. nominated archbishop of St. Andrews, with a promise of future preferment in England. In 1396, he was enthroned, with great pomp, as archbishop of Canterbury. He was a bitter persecutor of the Lollards and followers of Wickliffe, and a chief instrument in procuring the horrible act for the burning of heretics (*de heretico comburendo*), passed in the reign of Henry IV. He even carried his bigotry so far as to solicit from the pope a bull, for digging up Wickliffe's bones, which, however, was wisely refused him. He also procured a synodal constitution, which forbade the translation of the Scriptures into the vulgar tongue. Amongst others whom he caused to be convicted of heresy, and sentenced to the flames, was Lord Cobham, one of the principal patrons of the new sect, at the commencement of the reign of Henry V. Soon after, A. was seized with an inflammation in the throat, which proved fatal. He d. 20th Feb., 1413.

**ARUNDEL MARBLES**, part of a collection of ancient sculptures, formed about the beginning of the 17th c. by Thomas Howard, earl of Arundel, and presented in 1667 to the university of Oxford, by his grandson, Henry Howard, afterwards duke of Norfolk.

The principal portion of it is the "Parian chronicle," consisting of the fragments of an inscription in marble, supposed to have been executed in the island of Paros, about 263 B.C. In its perfect state, this inscription contained a chronological table of the principal events in Grecian history from the time of Cecrops (1583 B.C.) to the archonship of Diognetus (264 B.C.). The chronicle of the last 90 years is lost, and the extant portion of the inscription is much corroded and defaced. This curious and interesting monument, the authenticity of which has been questioned and vindicated with almost equal ingenuity and learning, was purchased for the earl of Arundel, along with many other relics of antiquity, at Smyrna, by Mr. (afterwards Sir William) Petty. The inscription, and all the other principal sculptures in the Oxford collection, are to be found fully illustrated in the relative publications of Selden, Prideaux, Maittaire, and Chandler, under the various titles of *Marmora Arundelliana* and *M. Oxoniensis*.

The nobleman whose name is associated with these ancient marbles is worthy of remembrance, independently of his general merits, as the first of his order in England who liberally encouraged the fine arts, and communicated the influence of his own taste and enthusiasm in their cultivation to a wide circle of imitators and successors. Among the scholars and artists on whom his liberal patronage was specially bestowed, were Francis Junius, the younger (his librarian), and Oughtred, the mathematician; Wenceslaus Hollar, the engraver, whom he brought over to England; Vandyck and Inigo Jones, and the sculptors Stone, Le Sueur, and Fanelli. His collection of works of art, for the supply of which, from the treasures of antiquity, he engaged the services of two distinguished men of letters, Evelyn and Petty, rivaled the galleries of princes. After his death, it was unfortunately dispersed, and many of his choicest treasures were forever lost sight of. His collection of sculpture alone, when entire, numbered 37 statues, 123 busts, and 250 inscribed marbles, besides altars, sarcophagi, fragments, and gems.

**ARUNDO.** See REED.

ARVA, a co. in n. Hungary; 803 sq. m.; pop. '69. 82,364. It is bounded on the n. and e. by Galicia; is mountainous and sterile, but grand in scenic effects. Timber is the main article of export. Chief t., Alsó-Kubin.

ARVAKR ("early awake"), in Norse mythology one of the horses of the sun; the other was called Alsvid, "all scorching."

ARVAL BROTHERS, a priesthood of 12 members anciently elected for life from the highest ranks in Rome, and including the emperor when there was one. Their duty was to offer yearly public sacrifice for the fertility of the fields, and the custom is said to have originated with Acca Larentia, foster-mother of Romulus, who, with her twelve sons, instituted such a festival. Another legend is that the foster-mother lost one of her sons, and Romulus permitted her to adopt him in his place, calling the twelve "fratres Arvales." Though little is said of the A. B. by Roman orators, their records up to a high antiquity, as given by themselves, were inscribed on stone. The college consisted of a master, vice-master, flamen, prætor, and eight members; and among their attendants were four boys, who were required to be sons of senators, and to have living parents. Each officer wore a wreath of green, a white fillet, and a white toga bordered with purple. The great annual festival under their charge was in honor of Dea Dia, who seems to have resembled the goddess Ops, wife of Saturn. It occupied three days, between the middle and end of May. On the first day was the ceremony of "touching" samples of old and young grain; on the second day the sacrifice of two white pigs, a cow, and a fat sheep, in a sacred grove beyond the city, followed by blessing, or "touching," samples of grain brought by the people, and after that the dance and song of brotherhood in the temple, and the election of officers for the coming year. On the third day there was a sacrifice in the city. The minor duties of the brothers were to offer sacrifice on the birthday of an emperor, or at the beginning of a consulate, or for escape from danger, or at the starting or ending of a journey, or on occasion of any important event touching the imperial family. On the 3d of Jan. they recited a particular form of prayer for the ruling emperor, and made sacrifice to the male and female deities.

**ARVICOLA.** See VOLE.

**AR'YAN RACE, AR'YAN LANGUAGES.** The name Aryan (less properly, Arian) race or Arian family of nations is now generally used to designate that ethnological division of mankind otherwise called Indo-European or Indo-Germanic. It consists of two branches, geographically separated, an eastern and a western. The western branch comprehends the inhabitants of Europe, with the exception of the Turks, the Magyars of Hungary, and the Finns of Lapland (see EUROPE); the eastern comprehends the inhabitants of Armenia, of Persia, of Afghanistan, and of northern Hindustan (see HINDUSTAN). The evidence on which a family relation has been established among these nations is that of language. Between Sanscrit (the mother of the modern Hindu dialects of Hindustan), Zend (the language of the ancient Persians), Greek (which is yet the language of Greece), Latin (the language of the Romans, and the mother of the modern Romanic languages, i.e., Italian, French, Spanish, Portuguese, Wallachian), Celtic (once the language of great part of Europe, now confined to Wales and some parts of Ireland and Scotland), Gothic (which may be taken as the ancient type of the Teutonic or Germanic languages—including English—and of the Scandinavian), and Slavonic (spoken

in a variety of dialects all over European Russia and a great part of Austria), the researches of philology have within the present century established such affinities as can be accounted for only by supposing that the nations speaking them had a common origin. No one of these nations, whether existing or historical, can claim to be the parent nation of which the others are colonies. The relation among the languages mentioned is that of sisters—daughters of one mother, which perished, as it were, in giving them birth. No monuments of this mother-language have been preserved, nor have we any history or even tradition of the nation that spoke it. That such a people existed and spoke such a tongue is an inference of comparative philology, the process of reasoning being analogous to that followed in the kindred science of geology. The geologist, interpreting the inscriptions written by the finger of nature herself upon the rock-tablets of the earth's strata, carries us back myriads of ages before man appeared on the scene at all, and enables us to be present, as it were, at creation itself, and see one formation laid above another, and one plant or animal succeed another. Now languages are to the ethnologist what strata are in geology; dead languages have been well called his fossils and petrifications. By skillful interpretation of their indications, aided by the light of all other available monuments, he is able to spell out, with more or less probability, the ethnical records of the past, and thus obtain a glimpse here and there into the gray cloud that rests over the dawn of the ages.

When these linguistic monuments are consulted as to the primitive seat of the Aryan nations, they point, as almost all ethnologists are agreed, to Central Asia, somewhere probably east of the Caspian, and north of the Hindu Kush and Paropamisan mountains. There, at a period long anterior to all European history—while Europe was perhaps only a jungle, or, if inhabited at all, inhabited by tribes akin to the Finns, or perhaps to the American Indians—dwelt that mother-nation of which we have spoken. From this center, in obedience to a law of movement which has continued to act through all history, successive migrations took place towards the north-west. The first swarm formed the Celts, who seem at one time to have occupied a great part of Europe; at a considerably later epoch came the ancestors of the Italians, the Greeks, and the Teutonic peoples. All these would seem to have made their way to their new settlements through Persia and Asia Minor, crossing into Europe by the Hellespont, and partly, perhaps, between the Caspian and the Black sea. The stream that formed the Slavonic nations is thought to have taken the route by the north of the Caspian. At a period subsequent to the last north-western migration, the remnant of the primitive stock would seem to have broken up; part poured southwards through the passes of the Himalaya and Hindu Kush into the Punjab, and became the dominant race in the valley of the Ganges; while the rest settled in Persia, and became the Medes and Persians of history.

It is from these eastern members that the whole family takes its name. In the most ancient Sanscrit writings (the Veda), the Hindus style themselves Aryans; and the name is preserved in the classic Arian, a tribe of ancient Persia, Aria, the modern Herat, and Ariana, the name of a district comprehending the greater part of ancient Persia, and extended by some so as to embrace Bactriana, Ariana, or Airyana, is evidently an old Persian word, preserved in the modern native name of Persia, Airan, or Iran. *Arya*, in Sanscrit, signifies "excellent," "honorable," being allied probably to the Greek *aristos*), the best. Others connect it with the root *ar* (Lat. *arare*, to plough), as if to distinguish a people who were tillers (*earers*) of the earth from the purely nomadic Turanians or Turks.

The several members of this ethnological group will receive special notice each in its place. As to the hypothetical mother-nation—the primitive Aryan stock before separation, it might seem impossible to affirm anything beyond its mere existence and locality. But the ethnologist does not content himself with this. In an admirable essay on *Comparative Mythology* (Oxford Essays, 1856), prof. Max Müller has drawn a picture of the Aryan family while yet one and undivided, in which the state of thought, language, religion, and civilization is exhibited in a multitude of details. Where the same name for an object or notion is found used by the widely spread members of a family, it is justly inferred that that object or notion must have been familiar to them while yet resident together in the paternal home. It is in this way established, that among the primitive Aryans not only were the natural and primary family relations of father, mother, son, daughter, hallowed, but even the more conventional affinities of father-in-law, mother-in-law, sister-in-law; that to the organized family life there was superadded a state organization with rulers or kings; that the ox and the cow constituted the chief riches and means of subsistence; and that houses and towns were built.

One general observation made by Müller is so interesting that we take the liberty of quoting it entire. "It should be observed," he says, "that most of the terms connected with chase and warfare differ in each of the Aryan dialects, while words connected with more peaceful occupations belong generally to the common heirloom of the Aryan language. The proper appreciation of this fact in its general bearing will show how a similar remark made by Niebuhr, with regard to Greek and Latin, requires a very different explanation from that which that great scholar, from his more restricted point of view, was able to give it. It will show that all the Aryan nations had led a long life of peace before they separated, and that their language acquired individuality and nationality as each colony started in search of new homes—new generations forming new

terms connected with the warlike and adventurous life of their onward migrations. Hence it is that not only Greek and Latin, but all Aryan languages have their peaceful words in common; and hence it is that they all differ so strangely in their warlike expressions. Thus the domestic animals are generally known by the same name in England and in India, while the wild beasts have different names, even in Greek and Latin."

In this mainly pastoral life, the more important of the primitive arts were known and exercised: fields were tilled; grain was raised and ground into meal; food was cooked and baked; cloth was woven and sewn into garments; and the use of the metals, even of iron, was known. The numbers as far as a hundred had been named, the decimal principle being followed. The name for a thousand had not come into requisition until after the dispersion, for it differs in the different Aryan tongues.

Finally, it was among the yet undivided Aryans, while abstract language did not yet exist, while every word was a metaphor, and the setting of the sun, for example, could only be expressed by his growing old and dying, that those stories of gods, heroes, and monsters originated, which, with more or less of variety, but still with a family-likeness, formed the pagan mythology of every member of the group.

AR'ZACHEL, ABRAHAM, a Spanish Hebrew astronomer of Toledo, who lived about 1060. He determined the apogee of the sun, and wrote on the obliquity of the ecliptic. It is said that his works were in part the foundation of the Alphonsine tables, made by order of Alphonso X. of Castile.

ARZIGNANO, a t. of north Italy, 11 m. w. by s. from Vicenza, in a plain surrounded by hills. It manufactures woolens, leather, and silk twist. Pop. '71, 2706.

AS was the designation both of a Roman weight (called also *libra*) corresponding very nearly to an English *pound* (q.v.), and also of a coin made of the mixed metal *aes*, or bronze. The A. (coin) originally no doubt weighed a (Roman) pound; but it was gradually reduced to  $\frac{1}{16}$  of a pound, and even lower. It is thus difficult to assign any fixed value to the A. About 270 B.C., the denarius (= 8 *d.*) contained 10 asses; so that the value of the A. was then a little more than 3 farthings; when 16 asses went to the denarius, the value was about a halfpenny. It was by the *sestertius* (q.v.) that money was reckoned at Rome. The oldest form of A. usually bore the figure of an ox, a sheep, or other domestic animal (*pecus*); from which it is usually supposed that the Latin word for money, *pecunia*, is derived.

A'SA, son of Abijah, and grandson of Rehoboam, was the third king of Judah. At the beginning of his reign, he was very young, and his character apparently undeveloped, for he allowed his grandmother, Maachah, to encourage idolatry; but on assuming the reins of government, one of his earliest acts was to remove her from all authority "because she had made an idol in a grove" (1 Kings, xv. 13; 2 Chron. xv. 16). His zealous efforts to extirpate the vices and impieties of the people were on the whole successful. He took away the Sodomites out of the land, and the altars of the strange gods, broke the images, and cut down the groves. For the next ten years, he devoted himself to strengthening the defenses of his kingdom, and organized a magnificent army of more than half a million, which seems to have been looked upon as a menace by other monarchs, for one of these, Zerah the Cushite, took the initiative, and penetrating through *Arabia Petraea*, invaded Judah, but was defeated with immense slaughter. Before the battle commenced, A. had invoked the aid of Jehovah; and some time after the victory, he and all his people entered into a solemn covenant "to seek the Lord God of their fathers with all their heart and with all their soul" (2 Chron. xv. 12). Peace lasted for twenty years in the kingdom, but in the 35th year of A.'s reign, war again broke out between him and Baasha, king of Israel. He sought and obtained the aid of the Syrian monarch, Benhadad, but at the expense of "the treasures of the house of the Lord;" and although successful against his adversary, he was indignantly upbraided and threatened by the prophet Hanani for not relying on Jehovah alone. A., flushed with success, threw the prophet into prison, and, it would appear, "in his rage" oppressed some of the people at the same time—perhaps those only who sided with Hanani, for we know that at his death the nation honored him with a splendid funeral; and the sacred historian pays the highest tribute to his memory, declaring that "A.'s heart was perfect with the Lord all his days." He reigned from 955 to 914 B.C.

A'SA DULCIS (i.e., sweet Asa), a drug in high repute among the ancients as an antispasmodic, deobstruent, and diuretic; also for supposed virtues of the most extraordinary kind, such as neutralizing the effects of poison, curing envenomed wounds, restoring sight to the blind, youth to the aged, etc. Its value was estimated by its weight in gold. The princes of Cyrene caused a figure of the plant producing it to be struck on the reverse of their coins, and it was sometimes called *lasar cyrenaicum*. The plant is of the genus *thapsia* (of the natural order *umbellifere*), either *T. garganica*, or a nearly allied species, *T. silphium*—perhaps the drug was produced by both. They are natives of the s. of Europe and of Barbary, and appear to be very active purgatives.

ASAFCETIDA, or ASSAFÆTIDA (i.e., fetid asa or assa), is a gum-resin, which has been supposed to be identical with the exuded juice of the *silphium* of Dioscorides, so highly esteemed among the Greek physicians; but which, perhaps, was rather the *asa*

*dulcis*. Its name is derived from the Persian word *asa*, which means a staff. This drug is brought from Persia and Afghanistan, and is procured by drying the milky juice which flows from the root of the plant *ferula* (*narthex*) *A.*, which has been referred to the genus *ferula* by Linnæus, and to *narthex* by Dr. Falconer. The root of the *A.* plant is long, and generally undivided; white inside, but having a black covering; and contains in its interior a quantity of juice of an overpowering odor, which much resembles that of garlic. *Ferula* or *narthex* *A.* has its radical leaves tripartite, their segments bipinnatifid, and nearly 2 ft. in length. The gum-resin is said by some to be obtained also from *ferula persica*, a plant which has the root-leaves very much divided, and all either tripinnate or quadripinnate. The name *ferula*, like the Persian *asa*, refers to the appearance of the stem of the plant. *Ferula persica* has long been propagated successfully in Britain, and even brings its seeds to perfection.

*A.* is prepared in the dry southern provinces of Persia, but chiefly in Khorassan and Afghanistan, and also to the n. of the Hindu Kush range of mountains. About April, the root-leaves are taken away, and the root itself is more or less exposed by removal of the soil from about it. After a lapse of six weeks, a slice is cut horizontally from its summit, and a thick white juice exudes, the smell of which even exceeds in strength that of the drug when dry. The drug is sometimes met with in the market in the form of tears, but more frequently in lumps, which are made up of irregularly shaped tears, agglutinated together by a softer substance. *A.* is extensively used in medicine, and possesses stimulant and anti-spasmodic properties. When taken internally, it undergoes absorption, and may be detected in almost every secretion of the body, as the saliva, breath, and urine. According to the analysis of Pelletier, *A.* is composed of the following substances: resin, 65 parts; volatile oil, 3.6; gum, 19.44; bassorin, 11.66; various salts, .80. In many parts of the east, this drug is used as a condiment, in which respect it seems to take the place of the garlic of some European nations.

**A'SAPH, ST.**, a cathedral city and a station on the Vale of Clwyd railway, stands on a small hill between the rivers Clwyd and Elwy, in the n.w. of Flintshire, Wales. The cathedral is a cruciform building, 178 by 68 ft., and was built in 1284 on the site of a wooden structure founded before 596. It has a tower 93 ft. high, is one of the smallest of British cathedrals, and stands on the top of the hill on which the city is built. Kentigern, or St. Mungo, bishop of Glasgow, and his disciple, St. A., are said to have founded the see of St. A. in the 6th century. The bishop, who has a revenue of £4200, is patron of 121 of the 148 benefices in the diocese. Pop. in '71, 1900. St. A., with the Flint district of boroughs, returns one member to parliament.

**A'SAPHUS.** See TRILOBITE.

**ASARABAC'CA** (*asarum europæum*), a plant of the natural order *aristolochiaceæ* (see ARISTOLOCHIA), a native of Europe, growing in woods; rare, and perhaps not truly indigenous, in Britain. The whole plant has acrid properties; the roots and leaves are aromatic, purgative, and emetic. The use of *A.*, however, as an emetic has been much superseded by that of ipecacuanha, which is milder and safer. The powdered roots and leaves enter into the composition of cephalic snuffs, which cause sneezing, and are employed as a counter-irritant in cases of headache, ophthalmia, toothache, etc. The plant contains a volatile oil, and a crystalline substance called *asarine*, to which it seems to owe its active properties. The genus *asarum* is distinguished by twelve horned stamens, distinct from each other and from the style, and by a bell-shaped three-lobed perianth. *A. europæum* has a very short stem with two shining kidney-shaped leaves on long stalks, from the axel of which springs a single drooping greenish-brown flower. —A nearly allied species, *A. canadense*, a native of Canada, is stimulant and diaphoretic, and is used under the name of CANADA SNAKEROOT, instead of *aristolochia serpentaria*. It is also called WILD GINGER, and used as a spice, being of a warm aromatic quality, and not acrid, like its European congener.

**ASBEN**, or A'Tr, a country of Central Africa, situated in 15° to 20° n. lat., and 6° to 11° e. long. Pop. estimated at 64,000. Its territory comprises a large amount of desert, as well as considerable tracts of mountain land. The inhabitants are chiefly of Berber extraction, and generally profess the religion of Mohammed. They are of a degraded character, and given to marauding. The climate is rather healthy, and generally hot and dry. The rainy season is from Aug. till Oct. The soil in many places is fertile, producing the doom palm, dates, and senna. Dr. Barth, the traveler, says of the aspect of the country: "Rocky ground, overtopped by higher mountain masses or by detached peaks, and hollows overgrown with rich vegetation, and preserving for a longer or shorter time the regular form of valleys, succeed each other by turns, and constitute the predominant feature of the country of Asben." The capital is Agades (q.v.).

**ASBESTUS**, a mineral very closely allied to tremolite, actinolite, and hornblende, and which, along with tremolite and actinolite, is often ranked among the varieties of hornblende. It consists chiefly of silica, magnesia, lime, and oxide of iron, and is of a fine fibrous character, the fibers sometimes combined together in a compact mass, sometimes easily separable, elastic and flexible. It is generally of a whitish or greenish color. The variety called *rock-cork* very much resembles cork, is soft and easily cut, and so

light as to swim in water. *Rock-leather* and *rock-wood* are varieties somewhat similar to rock-cork, but not so light. The finest fibrous variety with easily separable fibers is called *amianthus* (from a Greek word signifying *unpollutable*, as A. is from a Greek word signifying *indestructible*), because cloth made of it was cleansed by passing it through fire. This cloth was used by the ancients to enwrap dead bodies placed on the funeral pile, so as to preserve the ashes of the body unmixed. *Amianthus* has sometimes been used for the wicks of lamps, and is often employed to fill vinaigrettes, being moistened from time to time with a few drops of aromatic vinegar. The finest *amianthus* is found in the Tarentaise in Savoy. It is particularly abundant in Corsica. It is found also in Cornwall, at Portsoy in Scotland, and in several of the Shetland islands. None of the varieties of A. are very common, but they are not unfrequent in serpentine and allied rocks in different parts of the world. Minerals which resemble A. in their fibrous character are sometimes called *asbestous* or *asbestiform*, and some of them are believed to be varieties of augite rather than of hornblende.

ASBURY, FRANCIS, b. England, 1745, d. Va., 1816; the first bishop of the Methodist Episcopal church ordained in the United States. He obtained rudimentary education in a village school; at the age of 13 was converted; at 14 was apprenticed to a trade; at 16 became a local preacher; at 23 was received by Wesley into the itinerant ministry; and at 26 landed in Philadelphia as a missionary to America. It was but three years after the building of the first Methodist church in the country, and there were only about 600 persons of the faith, chiefly in Philadelphia and New York. When the revolution began, A. sympathized with the people, and while Mr. Rankin, who was his ecclesiastical superior, returned to England, A. remained, though, like many other non-jurors, he was subjected to suspicion, and at one time to imprisonment. After about two years of surveillance the authorities concluded that the scruples of A. and other preachers were not political, but religious, and he was permitted to go free. He improved his opportunity, and when the war closed there were 83 Methodist ministers at work, and the membership reached 14,000. In 1784, the several societies were organized into an Episcopal church, and A. was chosen bishop. Thenceforward his life was devoted to preaching and the superintendence and extension of churches. His labors were incessant, and his biography is itself a good history of the growth of Methodism in America. He never married, lest a wife should distract attention from his great work. He was always poor, and always generous. In 1785, he laid the foundation for the first Methodist college, and afterwards formed an educational plan for the whole country by making districts with at least one classical academy in each. He was rather stout, of medium height, with a fresh countenance and a penetrating eye. Wesley alone was his superior as a practical worker and organizer, and the two were alike in zeal and spirit. During his ministry it is estimated that A. traveled more than 270,000 m., visiting every part of the country; preached more than 16,000 sermons, ordained over 4000 ministers, and presided at 224 conferences. It is to the labors of this indefatigable apostle, more than to any other human cause, that Methodism in America owes its excellent organization and wonderful growth. His only written works were his journals in 3 vols., which are personally and historically of great value.

ASCALON, or ASHKELON, a ruined city of Palestine, situated on the shore of the Mediterranean, 36 m. w.s.w. of Jerusalem, and 12 m. n. by w. of Gaza. It was in ancient times a fortified city, and the principal town of one of the five lordships of the Philistines. Its name often occurs in the history of the people of Israel in the Old Testament, where it is represented as falling at an early period into the hands of the tribe of Judah. Herod the great embellished it with baths, palaces, and fountains; but in the subsequent wars with the Romans, it suffered much damage. There was a celebrated temple of Derketo, the Venus of the Syrians, at A., which is recorded to have been plundered by the Scythians, 630 B.C. After continuing long under the dominion of the Roman empire, the city came into the possession of the Saracens in the 7th century. In 1099, a great battle was fought on the plains of A., between the crusaders and Saracens, when the Christians gained a decisive victory. The city, however, a number of years after, was recaptured by the Moslems, and held by them as a strongly fortified place until 1153, when it was taken by the crusaders under Baldwin III. In 1187, it was retaken by the Saracens, but afterwards (1192) fell into the hands of Richard Cœur de Lion. Subsequently, being more than once dismantled and repaired during the wars between Richard and Saladin, it was reduced to desolation by sultan Bibars in 1270.

The ruins of this ancient city occupy an extensive semicircular eminence, sloping gently to the e. but abrupt and steep towards the sea. Part of the walls are still standing, with the remains of Gothic churches, a palace, and several edifices of more ancient date, which attract the notice of the traveler and the antiquary.

ASCARIS, a genus of *entozoa*, or intestinal worms, of the order *nematodea* of Zedar, Cuvier, etc., and of the division *stereimntha* of Owen. The ascarides have a body approaching to cylindrical, but thickest in the middle. They inhabit the intestines of animals. The species are numerous. One of the best known is *A. lumbricoides*, often called the common round worm, which occurs in the intestines of man and of some of the lower animals, as the hog, ox, horse, etc., and which often occasions severe disease, and sometimes death, particularly when it ascends from the intestines to the stomach. Its

presence even in its most ordinary situation in the small intestines, is attended with unfavorable effects upon the general health; and the greater the number present—which, however, is not usually large—the greater, of course, is the injury; although when they remain in the intestines, worms of this species are less injurious and less annoying than other and even much smaller intestinal worms. In subjects otherwise diseased, they occasionally find their way out of the intestines into the closed serous cavities of the body, and even pass through ulcerated parts of the external integument; but the mouth is formed only for suction, and is provided with no means of boring through the healthy intestine. An immense number of remedies (anthelmintics or vermifuges) have been proposed and used in order to expel this parasite, some of which are very effectual. They do not in general kill the worms, but act by making their dwelling-place disagreeable to them (see VERMIFUGE). It is, however, remarked by Küchenmeister, in his work on parasites, that the treatment of cases of this description is as yet purely empirical, because, although there must be a condition of the intestinal canal which favors the thriving of worms, we are by no means certain what it is.

The *A. lumbricoides* is ordinarily, in size and appearance, pretty much like the common earthworm (*lumbricus terrestris*), from which resemblance it has received its specific name, although the resemblance is rather in general form than in more essential characteristics. It has been seen 15 in. in length. Its mouth consists of three fleshy tubercles, which can be spread out upon the intestine to form a broad circular sucker, and within which there is a small tube capable of being protruded. The alimentary canal consists of a muscular gullet and stomach, and a thin-walled intestine. Between the muscular layers of the body is produced a pale reddish oily matter, with a strong and very peculiar odor, which is gradually communicated to spirit in which the worm is preserved. The males are smaller than the females, and much more rare. The females produce eggs in great numbers; but it is uncertain if ever they are developed within the intestine in which the parent worm resides. They are certainly capable of being developed elsewhere, and probably the young enter the intestines of the animals of which they are eventually to be the parasites, after having spent a certain stage of their existence in very different circumstances: the worm in a very young state having never been found in the intestines of man or of quadrupeds, the situation of its perfect development. The inhabitants of damp valleys are believed to suffer more than others from the *A. lumbricoides*. It is said also to be particularly frequent in persons who are much accustomed to eat raw leaves and roots; and it has been supposed that the young may exist, perhaps in an encysted state, in the bodies of insects or other very small animals which are accidentally eaten along with such food, as the young tapeworm finds its way into the human intestines from its residence as a creature of very different size and form in the flesh of the sheep or the pig. The once prevalent idea of the equivocal generation of these worms is now completely abandoned.

*A. vermicularis* is another species usually referred to this genus, and is the only other species troublesome to mankind. It is known as the thread-worm or maw-worm, and is very common both in children and adults. It infests chiefly the lower part of the intestines, and particularly the rectum, great numbers being often present together, and occasioning intolerable itching, irritation, and loss of sleep, although there is not in general much serious injury to health. The same anthelmintics employed against other intestinal worms are found efficacious also in the expulsion of this; and clysters are often employed with great success. The thread-worm is white, not more than half an inch in length, the male much less. Some recent authors of high reputation have separated this species from *A.*, and call it *oxyuris vermicularis*, but the term *ascarides* is often employed in medical works with exclusive reference to it; and indeed this name, derived from the Greek *askarizo*, to jump or move briskly, probably owes its origin to the liveliness of motion which this species exhibits. It has been recently discovered that its nervous system is very highly developed, consisting of many ganglia, with connecting and ramifying cords.

**ASCENDANT.** In astrology, the easternmost star in a horoscope is the A., or "house of life." It was deemed to have the most influence on destiny, or to give the strongest indication of the future; so it is said when one's prospects improve, "his star is in the ascendant."

**ASCENSION**, one of the comparatively few single islands on the globe, being about 800 m. to the n.w. of St. Helena, and almost as far to the s.s.w. of St. Matthew. It is said to have received its name from the circumstance of its having been discovered by a Spanish navigator on Ascension day. It is nearly in the middle of the south Atlantic, the lat. of its fort being 7° 55' 55" s., and its long. 14° 25' 5" w. A. is 8 m. long by 6 broad; its area being about 35 sq. m. Though it was discovered as early as 1501, yet it remained uninhabited till 1815, when, in connection with Napoleon Bonaparte's detention in St. Helena, the English took possession of it. It is now used as a naval victualing station and hospital. Pop. (census of 1871) 27, 15 being residents on the island, and 12 being in the royal naval hospital. Like St. Helena, it is of volcanic origin, and generally mountainous—one peak rising to a height of 2870 ft. From the extreme dryness of the climate, which, however, is healthy, the surface is nearly destitute of verdure.

Among indigenous productions are the tomato, castor-oil plant, and pepper; European vegetables are cultivated. See Mrs. Gill's *Six Months in A.* (1879).

**ASCENSION, RIGHT** (Lat. *ascensio*, a rising; Ger. *gerade aufsteigung*), the name given in astronomy to one of the arcs which determine the position relatively to the equator of a heavenly body on the celestial sphere, the other being the declination. See **ARMILLARY SPHERE**. It is the arc of the equator intercepted between the first point of Aries (q.v.) and the point at which the circle of declination passing through the star cuts the equator. Measured always from w. to e., right A. on the heavens corresponds to longitude on the earth. The right A. of a heavenly body is ascertained by means of the transit instrument and clock. The transit instrument determines its meridian passage, and the transit clock gives the time at which this takes place. When the first point of Aries is in the meridian, the clock stands at 0 hours, 0 minutes, 0 seconds, and it is so arranged as to indicate 24 sidereal hours, the time that elapses between two successive passages of that point. The reading of the clock, therefore, at the passage of any heavenly body gives its right A. in time, and this, when multiplied by 15, gives the same in degrees, minutes, and seconds. The right A. is usually given, however, in time. The old term, *oblique A.*, was given to the right A. of the point of the equator that rose simultaneously with the heavenly body; and the difference of the oblique and right A. was called the "ascensional difference."

**ASCENSION**, a parish in s.e. Louisiana, on both sides of the Mississippi, s.w. and w. of Amite river and lake Maurepas; 420 sq. m.; pop. '70, 11,577—7310 colored. The soil is alluvial and frequently inundated, but is extremely productive in corn, cotton, rice, sugar, and molasses. Chief t., Donaldsville.

**ASCENSION DAY**, or **HOLY THURSDAY**, one of the great religious festivals of the Episcopal and also of the Roman Catholic church. It is held on the fortieth day after Easter, and is intended to commemorate the ascension of Christ into heaven. It is one of the six days occurring in the year for which the church of England appoints special psalms, and the same church also particularly recommends it as a fitting day for the receiving of the communion. Ascension day has been observed from the earliest times of the Christian church. St. Augustine believes it to have been instituted either by the apostles themselves, or the primitive bishops succeeding them. Connected with the religious observances of this day were certain civic ones, which in some parts of England and Scotland are continued to this day—viz., *beating the bounds*, or *riding the marches*, though their religious connection is apparently forgotten. See **ROGATION DAYS** and **PERAMBULATION**.

**ASCETICISM**. Among the Greeks, *askēsis* denoted the exercise and discipline practiced by the athletes or wrestlers, who had to harden their bodies by exertion and to avoid all sensual and effeminating indulgences. In the schools of the philosophers, especially of the Stoics, the same word signified the practice of mastering the desires and passions, or of severe virtue. In these senses it passed into the language of the early Christians. The language of St. Paul in comparing the Christians to wrestlers who had to contend with Satan, the world, and the flesh, contributed to this. But the philosophy of the time had more to do with it, which held the freeing of mind from matter to be the means of union with God; or, at least, that the refraining from all luxurious pleasure was the way to restore the soul to its original purity. To understand the vast influence that ascetic ideas have exercised on the Christian religion, we must look beyond the bounds of its history. Their root lies in the oriental notion that the absolute or all is the only real existence; and that individual phenomena, especially matter in all its shapes, are really nothing, and are to be despised and avoided, as involving the principle of separation from the absolute. The east, accordingly, is the native soil of A. The glowing imagination of the oriental carries the practice of it to a monstrous extravagance, as is seen in the frightful self-tortures of the yogis and fakirs, the suicides in the sacred Ganges and under the wheels of Juggernaut, and the practices now or recently prevalent of offering children in sacrifice, and of burning widows; most of which, however, have been humanely suppressed by the efforts of the British government. Buddhism, which may be considered as a kind of puritan revival or reformation—the methodism of the Indian religion—carried the principle beyond its previous bounds. In its condemning the world, in its inculcating a life of solitude and beggary, mortification of the body, and abstinence from all uncleanness and from all exciting drinks, the object was to keep as distant and detached as possible from this "vale of sorrow" (see **BUDDHISM** and **NIRVANA**). The sober Chinese, and the more moral and rational Persians, never carried asceticism to these extravagances; and the earnest Egyptians sought to confine it to monogamy of the priests, abstaining from the flesh of swine and from beans, rigid purity, circumcision, moderate flagellation, and frequent contemplation of death (which there were arrangements for bringing to remembrance, even in the midst of festivities). These are certainly milder forms of A., but the principle is the same.

It is in the light of this fore-history that we must consider Judaic and Christian asceticism. In the oriental mind, especially in Egypt, circumcision, avoiding of all uncleanness, and fasting, were signs of humiliation before God; and in the Mosaic ritual they were conditions of the favor of the holy Jehovah. Voluntary vows, abstaining even

from lawful food, wine, etc., were held to have a special purifying, consecrating efficacy, particularly for prophets and men of special callings. But self-castigation continued for long foreign to the sobriety of Judaism, and even hermitism came into established practice only shortly before Christ, in Palestine among the Essenes (q.v.), in Egypt among the Therapeutæ (q.v.); though doubtless Jewish A. had become more stern and gloomy since the exile in Babylon.

A. was far less congenial to the reflective nations of the west, above all to the cheerful Greeks. A Greek felt himself entitled to enjoyment as well as his gods; hence Greek religious festivals were pervaded by cheerfulness. The only exception appears to be the Eleusinian mysteries, which never took hold of the people generally, and the passing phenomenon of the Pythagorean fraternity. The attack made by the Socratic school upon the body as the prison of the soul—a view reminding one of the east—and the extravagant contempt for the elegances and even decencies of life, professed by the later Stoics and Cynics, were no genuine fruits of the popular Greek mind: and we must also ascribe to the infusion of oriental philosophy the ascetic tendencies of Neoplatonism, in holding abstinence from flesh and from marriage as chief conditions of absorption into the divinity.

It was into the midst of these ideas that Christianity was introduced. The Jewish converts brought with them their convictions about fasting. Fasting and Nazaritic observances were thought sanctifying preparatives for great undertakings; and the inculcation of abstinence from marriage, on the ground of the expected speedy re-appearance of Christ, falls in with the same notion, namely, that the flesh, that is, the sensuous part of our nature, is the seat of sin, and must therefore, before all things, be rigorously chained. The old oriental traditions of A.; the spirituality of Christianity, pointing away from earth to heaven; opposition to the corruption of the heathen world; the distinction made between belief and knowledge, as a higher and lower stage of intelligence, leading to a corresponding distinction of a higher and lower stage of virtue: all combined to make the Christians of the first two centuries hold aloof from the world and its wisdom, and favor abstinence from marriage, more especially on the part of the clergy. This ascetic spirit began as early as the commencement of the 2d c. to court trial in the perilous practice of men and women living together under vows of continence. We find Cyprian dissuading from the dangerous experiment, and even the authority of the church interposed to the same effect. But during the first three centuries no irrevocable vows yet bound the devotees to a life-long A. Fasting was also comparatively rare.

But the tendency to outward manifestations now began to grow stronger. The inward and spiritual life of the Christians had greatly declined; and if the previous bloody persecutions had driven individuals from human society into the deserts, the growing secularization of the church, after Christianity became the state religion, had the same effect to a still greater degree. All this paved the way for the chief manifestation of A.—namely, monasticism, which the church found herself compelled by the overwhelming tide of opinion within and without to recognize, and to take it under her protection and care. See MONACHISM. From the African church, represented by Tertullian and Augustine, a spirit of gloomy and crushing supernaturalism spread deeper and deeper over the western church generally, intensifying the ascetic tendencies, and leading to still more marked separation from a despised world. There were not wanting healthier minds—as Jovianus, Vigilantius, and others—to raise their voices against fasting, monkery, and the outward works of A. generally; but such protests were vain, and became ever rarer.

From the 11th c., the Cathari, Waldenses, and other sects, though ascetics themselves in a way, yet assailed the external A. of the church; the classic Petrarch fought on the same side; and so did Wicliffe, Huss, and Jerome of Prague, in their premature struggles at reformation. After a preliminary skirmish by Erasmus, the struggle was decided in the reformation of the 16th c. The fundamental principle of that movement, that salvation is secured by justification through faith, and not through dead works, struck at the root of monkery and mortification in general. But the victory has not been so complete as is often assumed. The ascetic spirit often shows itself still alive under various disguises even in Protestantism. The Mennonites inculcated a rigid A.; and with the Shakers of America, celibacy is practiced as a virtue. The essence of A. is to hold self-denial and suffering to be meritorious in the sight of God, in and for itself, without regarding whether it promotes in any way the good of others or the improvement of the individual's own character. In this light, many traits presented by Puritanism, Methodism, and Quakerism appear ascetic. It is not impossible that vegetarianism, total abstinence, and other recent austerities, though advocated on other grounds, recommend themselves to the feelings of many from their falling in with this deep-seated propensity to A.; which seems a relic of that dread of the malignity of the invisible and supernatural powers which haunts the human mind in an unenlightened and savage state.

Even in the Romish church, ascetic practices have been modified in recent times; fastings are less rigorous, and the self-sacrifice of conventual life is more directed to beneficial ends. Mohammedanism has undergone the same change. In the Greek church, monasticism had always a milder form.

**ASCH**, a t. in the w. of Bohemia, 100 m. w.n.w. from Eger. It has cotton, linen, and woolen manufactures. Pop. '69, 9405.

**ASCHAFENBURG**, the chief t. on the right bank of the Maine, in the Bavarian district of Unterfranken (lat.  $50^{\circ} 1' \text{ n.}$ , long.  $9^{\circ} 7' \text{ e.}$ ). It is built upon an eminence, and has both a healthy and attractive situation; but the streets are narrow, irregular, and slope steeply towards the river. The castle of Johannisberg, built between 1605-14, by Johann Schweikhardt, elector of Mentz, and the favorite hunting residence of many of his successors, forms a quadrangle, with towers at each corner, and overlooks the whole town. Besides the collegiate church, the military barracks, and the town-hospital. A. possesses a Roman villa, built by the late king Louis, in imitation of the Castor and Polux edifice discovered at Pompeii. It is celebrated for its manufacture of colored papers, besides carrying on a considerable trade in wood, building-stone, tobacco, wine, etc. Pop. '75, 10,849, principally Catholics. A. existed as early as the invasion of Germany by the Romans, who built a castle here. In 974, Otto I., duke of Swabia and Bavaria, founded the collegiate church, which greatly increased the prosperity of the place. After Otto's death, it came into the possession of the archbishops of Mentz, and remained with them until the dissolution of the Germanic empire. In 1814, along with the principality of which it is the capital, it was ceded to Bavaria by Austria.

**ASCHAM**, ROGER, a distinguished English writer and classical scholar, was b. in 1515 at Kirby Wiske, in Yorkshire. He received his early education in the family of Sir Anthony Wingfield, and in 1530 entered St. John's college, Cambridge, where he took his degree of M.A. in 1536. The study of the classics, especially Greek, had recently been revived at Cambridge, and the natural bent of A. impelled him with ardor to these studies. His reputation as a classical scholar soon brought him numerous pupils; and there being at that time no Greek chair, he was appointed by the university to read lectures in the public schools. He at first opposed the then new method of pronunciation which is still used in England; but afterwards adopted and defended it. His leisure hours were devoted to music, penmanship, in which he excelled, and archery. In defense of the latter art, he wrote, in 1554, a treatise entitled *Toxophilus*, the pure English style of which, independently of its other merits, ranks it among the classical pieces of English literature. For this treatise, which was dedicated to Henry VIII., he was rewarded with an annual pension of £10, equivalent to about £100 of our present money. About the same time, he was appointed university orator. In 1548, on the death of his former pupil, Grindal, he was called to supply his place as master of languages to the lady Elizabeth. In this office he gave the highest satisfaction; but at the end of two years abruptly resigned it, on account of some offense he had taken at some persons in the princess's household. That he did not lose favor at court, however, is manifest, from his having soon after been appointed secretary to Sir Richard Morvinsine, ambassador to the court of Charles V. He spent three years in Germany, and published an account of his observations in that country. He also made a short tour in Italy. During his absence, he had been appointed Latin secretary to Edward VI. On his return, after the death of the king, the interest of Gardiner, bishop of Winchester, secured his appointment to the same office under Mary; his pension also was doubled. His prudence and moderation preserved him from offending by his Protestantism. After the death of Mary, Elizabeth retained him at court in the double capacity of secretary and tutor, which he discharged till his death, in 1568. His principal work, *The Schoolmaster*, a treatise on classical education, was published in 1571 by his widow. His Latin letters and poems have been frequently reprinted. The best edition of the former is that of Elstob (Oxford, 1703). To an edition of his English works, by the Rev. J. Bennet (1767), is prefixed a life by Dr. Johnson.—**ASCHAM**, a case for the reception of the bow, arrows, strings, and other accoutrements of the archer, derives its name from the author of the *Toxophilus*.

**ASCHE**, RABBI, b. at Babylon, 353 A.D.; the first and principal editor of the "Talmud," on which he worked 30 years, leaving the finishing to his disciples, Abina and Jose. He was a man of great learning.

**ASCHERSLEBEN**, a t. in the district of Magdeburg, in the province of Prussian Saxony, lat.  $51^{\circ} 46' \text{ n.}$ , long.  $11^{\circ} 27' \text{ e.}$  It is situated on the river Eine, is 32 m. distant from Magdeburg, and has a pop. of (1875) 17,532. The inhabitants are chiefly occupied in agriculture and gardening, but its trade is not very important. It has, however, considerable manufactures of woollens, linens, earthenware, etc. In the vicinity are some ruins erroneously supposed to be those of the old burgh of Ascania, the original seat of the house of Anhalt.

**ASCIA NO**, a t. of north Italy, 12 m. s.e. from Siena, on the left bank of the Ombrone. Pop. '71, 3430.

**ASCIANS**, or **ASCI**, people near the equator, who have the sun over their heads, and consequently have no visible shadow, twice a year.

**ASCIDIA**, a Linnæan genus of marine mollusca, now much restricted as a genus, but the type of a family called *ascidiade*. The name ascidians is also commonly employed to designate all those tunicated mollusca which form the order *saccobranchiata* of Owen, or in which respiration is carried on by means of gill-sacs (*branchial sacs*); and these are

divided into compound and solitary ascidians (*aggregata* and *solitaria*). The ascidians, along with the other *tunicata*, are acephalous, or destitute of a head, and are inclosed, not in a shell, but in an elastic tunic with two orifices, composed of a substance apparently identical with the *cellulose* of plants, consisting only of carbon and hydrogen. Within the external tunic is a muscular membrane, regarded as corresponding to the *mantle* of other mollusca, and the openings of which agree with those of the tunic. The greater part of the cavity of the mantle forms a branchial sac, the lining of which, folded in various ways, constitutes the gills (*branchiæ*); and into it currents of sea-water are continually brought by the respiratory movements, passing out through the vent or anal orifice. Multitudinous *cilia* in the mouth and branchial sac, cause by their action this continual flow of water. The motion of the *cilia* is apparently quite involuntary. By this flow of water, the particles of food requisite for the animal are brought in, so that the aëration of the blood and the supply of the stomach are carried on together and by the same means. The oesophagus or gullet opens from the branchial sac, which is indeed regarded as probably an expansion of the upper part of it—a dilated pharynx. Under the branchial sac is the stomach; and the alimentary canal, which is more or less tortuous, finally returns upon itself, so that the two orifices are not far separate. The liver consists of follicles produced into tubes, and communicating with the stomach by a single opening. There is a heart and a circulation of blood, with the remarkable peculiarity of alternations in its course, the circulation every now and then pausing and being reversed. The transparency of many of the ascidians permits these and other internal movements to be easily observed. The nervous system is very simple, consisting of a single ganglion, situated between the mouth and the anal orifice, and which sends out filaments to both of them, and other branches over the surface of the mantle. The mantle is capable of contracting suddenly to eject a jet of water, and along with it any body the presence of which is disagreeable. It also contracts and ejects water, if the animal is touched, and this appears to be the only means of defense which these creatures possess. There is no trace of eyes or of other organs of special sense.

The ascidians are found in all seas, and often constitute an important part of the food of fishes. Some of them are occasionally used as human food, as *Cynthia microcosmus* on the shores of the Mediterranean. Many of them are very small, but some attain a size of 5 or 6 in. in diameter, and when touched, eject water to a considerable height, the largest of them to about 3 ft. They are all fixed by the base, in their mature state, to some solid substance, as a rock or seaweed; sometimes by the intervention of a stalk or peduncle. In some kinds (*social ascidians*), the peduncles of a number of individuals are connected by a tubular stem, and to some extent they have a common circulation of blood, although each has its own heart, respiratory apparatus, and digestive system; and if a ligature is drawn around the peduncle of one so as to cut it off from the common circulation, circulation takes place in it as in a solitary ascidian. In other kinds (more strictly called *compound ascidians*—which designation, however, is by some authors applied to those just described, whilst these are called *aggregate ascidians*), the tunics of many are united into a mass, and they form systems like zoophytes. The compound system sometimes bears a general resemblance to an actinia. Very frequently it forms a slimy crust upon algae, shells, etc., or projects in globular or conical masses, "more like a lump of inanimate matter than a being endowed with vitality"—"a curious and interesting internal organization, veiled by the coarsest exterior." The individuals are sometimes connected by a gelatinous flesh, which consists of cellulose, and there is sometimes a calcareous deposition in this connecting substance as in the compound polypes. The individuals in these systems have always sprung by generation from one, and both the solitary and compound ascidians propagate by eggs. The young have the power of active locomotion, resemble tadpoles in form, and swim by means of a vibratile tail, which disappears when they settle, being usually detached by contraction at the base. The sexes are supposed to be distinct only in some of the ascidians. The ovaries are usually large, and the ova are carried away by the stream which passes through the animal. It is in the solitary ascidians that the highest organization is to be observed, and in which alone a distinction of sexes appears. In them, a muscular ring surrounds the mouth, and can be closed to exclude what is unfit to enter. Within this aperture there is also a fringe of tentacula, short and simple, or longer and minutely divided. In the compound ascidians, gemmation does not begin till the single animal has been fully developed; thereafter, bud after bud is produced, according to the plan upon which the compound system is constructed, and "the procreative force of the germ-mass finally exhausts itself in the formation of male and female organs, in which that force is again mysteriously renewed under its two forms of the spermatozoon and the germinal vesicle, by the combination of which the reproductive cycle again begins its course."

The name ASCIDIAN ZOOPHYTES (*zoophyta ascidioida*) has been used to designate those zoophytes or polypes which form the class *polyzoa* of Thompson, *bryozoa* of Ehrenberg, and which in certain features of their organization resemble the A., although in other respects they widely differ from them. The *alcyonidium* and *alcyonella*, already noticed in the article *alcyonidium*, belong to this class. See POLYPT and ZOOPHYTE.

ASCLEPIADACEÆ, or ASCLEPIADEÆ, a natural order of dicotyledonous or exogenous plants, mostly shrubs, often with twining stems, almost always with milky juice. The leaves are entire, and have cilia between their stalks in place of stipules. The flowers are

peculiar in their structure, although symmetrical and regular. The calyx is divided into five segments, the corolla into five lobes; there are five stamens, and the stigma has five angles. The filaments are usually united so as to form a tube, which is generally furnished with a coronet of peculiar hood-shaped appendages; the anthers are two-celled, the pollen grains cohering in wax-like masses, which fall out of the anther cells, and become attached to glands at the angles of the stigma; there are two ovaries and two styles very close together, and often very short, with one dilated stigma common to both. The fruit consists of two follicles, or, by abortion, of one only, having numerous imbricated seeds with thin albumen, the ends of the seeds terminating in long down. There are about 1000 known species, chiefly natives of warm climates. Some of them are cultivated in gardens and hot-houses, upon account of their curious or beautiful flowers, among the most familiar of which are some of the species of *asclepias* (q.v.) or swallow-wort; perhaps none of them is more highly or deservedly esteemed than *stephanotis floribunda*, the fragrance of which equals its beauty, and which, since its introduction into British hot-houses, has been sought for the bridal garlands of the highest aristocracy. No hot-house climber is better known than *hoya carnosa*, at each flower of which a drop of honey is always found to hang. A number of species are medicinal, as Indian sarsaparilla (q.v.) (*hemidesmus indicus*); mudar (q.v.) (*calotropis gigantea*), so highly prized in the East Indies; *sarcostemma glaucum*, the ipecacuanha of Venezuela; *tylophora asthmatica* and *secamone emetica*, the roots of which are used as emetics, and in smaller doses as cathartics, and the former of which is reckoned among the most valuable medicinal plants of India; *cynanchum acutum*, which yields a purgative called Montpellier scammony, and *vincetoxicum officinale*, which possesses similar properties. Argel (q.v.), much used for adulterating senna, belongs to this order.—The down of the seeds is sometimes employed as a substitute for silk or cotton (see ASCLEPIAS); and the stems of not a few species afford useful fibers, as those of the *asclepias syriaca* (see ASCLEPIAS), the mudar (q.v.) and other species of *calotropis*, natives of India and Persia, *hoya viridiflora*, *holostemma rheedeanum*, etc. The mudar or yercum fiber is very highly extolled by Dr. Royle (*Fibrous Plants of India*). The bark of *marsdenia tenacissima*, a small climbing-plant, yields a fiber called *jetee*, of which the Rajmahal mountaineers make bowstrings, remarkable for their great elasticity, which they are supposed in some measure to owe to the presence of caoutchouc. The fiber of *M. voylei* is used in Nepal. *Orphanthera viminea*, which grows at the base of the Himalayas, and has long leafless wand-like stems of 10 ft. in height, yields a fiber of remarkable length and tenacity, and which is supposed to be peculiarly suited for rope-making. The fibers of *leptadenia jacquemontiana* and *periploca aphyllum* are used in Sindh for making the ropes and bands used in wells, as water does not rot them.—The milky juice of most species of A. is acrid, but in some it is bland, and they are used for food, as is the milk itself of the kiriaughuna or cow-plant of Ceylon (*gymnema lactiferum*). A few species, as *marsdenia tinctoria*, a native of Silhet, yield indigo of excellent quality. The flowers of the genus *stapelia* have a strong smell of carrion, and flies sometimes lay their eggs upon them, as it were by mistake.—No species of A. is a native of Britain.—The order is generally regarded as nearly allied to apocynaceæ.

ASCLEPIADÆ, an order of men in Greece of whom the most were trained as physicians. They claimed to be descendants of the god Esculapius. In the course of their initiation and progression the Hippocratic oath was a part of the ceremony. At the close of their studies they had a ceremony of consecration, after which they were allowed to practice the healing art.

ASCLEPIADES, a Greek physician, born at Prusa, in Bithynia, who flourished during the early part of Cicero's life. He has been confounded with several other persons of the same name, and, in consequence, our accounts concerning him are both confused and contradictory. He seems to have wandered about considerably before he finally settled at Rome, as we read of his being at Alexandria, Parium on the Propontis, and Athens. It is not known either when he was born or when he died. A. was opposed to the principles of Hippocrates in medicine. Pliny, who professes very little respect for him, reduces his medicinal remedies to five: abstinence from flesh, abstinence from wine under certain circumstances, friction, walking, and "gestation" or carriage exercise, by which he proposed to open the pores, and let the corpuscles which caused disease escape in perspiration, for his leading doctrine was that all disease rose from an inharmonious distribution of the small, formless corpuscles of which the body was composed. He is said to have been very popular with the Romans on account of his pleasant and simple cures. His maxim was that a physician ought to cure surely, swiftly, and agreeably—a thing which, unfortunately, is not always possible. A. is also alleged to have been the first who distinguished between acute and chronic diseases, but his knowledge of anatomy was apparently very slight. The fragments of his which remain have been gathered together, corrected, and published by Gumpert, under the title, *Asclepiadis Bithyni Fragmenta* (Weimar, 1798.)

ASCLEPIAS, or SWALLOW-WORT, a genus of plants, the type of the natural order *asclepiadaceæ*. The corolla is wheel-shaped and reflexed; the coronet fleshy, and each of its hooded tips has a horn. The species are generally upright—seldom climbing and twining—herbaceous plants with opposite, whorled, or alternate leaves. They are

mostly American. The flowers are disposed in simple umbels between the leaf-stalks.—*A. syriaca*, Syrian or Virginian swallow-wort, sometimes called Virginian silk, appears to be a native of North America, and not of Syria, as was supposed. It is frequently cultivated in flower-gardens. It has an unbranched stem 4 to 7 ft. high; thick, ovate leaves, covered with a grayish down on the under side; and large, stalked, nodding umbels of many dull red flowers, which diffuse a strong and sweetish odor. The whole plant is full of an acrid white milk, which contains caoutchouc. The young shoots are eaten in North America like asparagus, as those of *A. stipitacea* are in Arabia. A brown well-tasted sugar is prepared in Canada from the flowers; and the silk-like down of the seeds has been used for the manufacture of textile fabrics, either alone, or along with wool or silk, but is more frequently employed for the preparation of wadding, and for stuffing mattresses and pillows. The plant appears, however, to be chiefly valuable for the fiber of its stalks, which is used for the manufacture of thread, cloth, ropes, nets, etc., in many parts of North America, and upon account of which it has been recommended for general cultivation in Europe. The fiber is said to be of very superior quality. The plant rapidly extends by its creeping roots, and readily becomes a weed, where it has been introduced.—The roots of several other North American species are used as diaphoretics and expectorants, as *A. incarnata*, *A. tuberosa*, etc. The latter is a very ornamental garden-flower, and is called butterfly weed and pleurisy root in the United States, where it is frequent on stony and sandy grounds. *A. curassavica* is called wild ipecacuanha in the West Indies, and a decoction of it is used by the negroes as an emetic and purgative.

**ASCOLI** (anciently, *Asculum Picenum*), an old city of Italy, capital of the province Ascoli-Piceno, and the seat of a bishop, lat. 42° 50' n., long. 13° 37' e. It is built on a hill, on the right bank of the Tronto, which formed the boundary between the late Roman and Neapolitan territories. Pop. '72, 22,937. From the Adriatic, it is distant 16 m. w.; from Ancona 53 s. Its harbor (Porto d'Ascoli) has some coasting-trade, and is defended by two forts. The town is beautifully situated, commanding a fine view of the fertile valley through which the river flows, and of the rugged Apennines, which here rise to an elevation of 7212 ft.

In ancient times, it was inhabited by the Piceni, the descendants of a colony of Sabines, who maintained their independence against the Romans until 268 B.C. Nearly two centuries after, they took a prominent part in the social war; and on the taking of their town by Pompeius Strabo, were subjected to the severest punishments. The town was annexed to the Papal states by pope Clement V. in 1436; and with them passed to the kingdom of Italy.

**ASCOLI DI SATRIA'NO**, a t. in Italy on the e. slope of the Apennines, 65 m. e.n.e. of Naples; pop. 6500. It was the ancient *Asculum Apulum*, and near it Pyrrhus defeated the Romans, 279 B.C. Here too, in 1190, Tancred defeated the forces of Henry VI. Remains of the Appian way can yet be seen near the town.

**ASCOLI-PICE'NO**, one of the four provinces of the Marches, in central Italy, formerly in the papal territory; 809 sq. m.; pop. '72, 303,004. In the province are branches of the Apennine mountains, and four or five small rivers. Wine, oil, honey, corn, fish, silk, and wool are produced. Chief town, Ascoli.

**ASCOT HEATH**, an English race-course in Berkshire, 26 m. from London, near the London and Southern railroad. The annual meeting in June is, for a large portion of the public, one of the important events of the year.

**ASCUTNEY MOUNTAIN**, a rocky mass, 3300 ft. above sea-level, in Windsor co., Vt. Its top presents a splendid panorama.

**ASELLI, ASELLIO, or ASELLIUS**, CASPAR, a celebrated Italian physician, was b. at Cremona, about the year 1581. He served at first as a military surgeon, but afterwards became professor of anatomy and surgery at Padua. In 1622, while at Milan, where he was in the habit of spending a great portion of his time, he discovered the lacteal vessels. Before A.'s time, anatomists had supposed that the chyle was carried from the intestines into the liver by the mesenteric veins. Happening one day to dissect a living dog, he noticed for the first time the multitude of little vessels, which suck up the nutritive portion of the food. At first, he took them for nerves, and did not pay particular attention to them; but on pricking one with the point of his scalpel, a white liquid spirted out, and the discovery flashed on him in a moment. He seems, however, never to have understood or described them with complete accuracy. He d. at the age of 45, leaving a treatise on the subject of his discovery, which was published a year after his death. It is entitled *De Lactibus, sive Lacteis Venis, Quarto Vasorum Mesaraicorum Genere, Novo Invento, Dissertatio*, and has several times been reprinted.

It is curious to reflect that such men as Gaspard Hoffman and Harvey zealously combated the opinions of A. It was nearly half a century before professional men admitted that a great discovery had been made in anatomy. See **LACTEALS**.

**ASEL'LUS**, in ichthyology, a generic name now disused, but by which the cod and other gadide were formerly sometimes designated. It is retained in the pharmacopœias, in the name of cod-liver oil, *oleum jecoris aselli*.—The same generic name is now employed, in a different department of natural history, to denote a genus of small isopod crustaceans,

one of which, *A. aquaticus*, is common in stagnant ponds in Britain, and is sometimes called the water hog-louse. This genus is the type of a family, *asellidae*.

**A'SES.** The singular of this name in old Norse, is *As*, pl. *Æsir*; in Gothic, *Ans*; in Saxon, *Os* (*Es*). The *A.* are a race of gods in northern or Scandinavian mythology (q. v.), though not the oldest, yet the most powerful, like the Jupiter dynasty among the Greeks. They are usually considered as numbering twelve gods, and as many goddesses. The gods are—Odin, Thor, Baldur, Niord, Freyr, Tyr, Bragi, Heimdal, Widar, Wali, Ullr, and Forseti; the best known of the goddesses—Frigga, Freyja, Idunna, Eira, and Saga. The worship of the *A.*, or the Odin religion, was rooted not only among the nations of Scandinavia, but among the Germanic races generally, at least in its outlines. Besides other traces, proofs of its prevalence are to be found in a multitude of Gothic, Saxon, and old high German proper names, many of which continue still in use, though their connection with German paganism passes unperceived: Oswald, Esmond, Oswin, Anselm, Ansgar, etc.

**AS'GARD** (from *As*, "god," and *gard*, "home"), the home of the Norse gods, or the Scandinavian Olympus. It was said to stand in the middle and highest part of Ida's plain, which is the center of the universe. There the *Æsir* (gods) built a court, or hall, with seats for twelve, and one high-seat for Odin, the all-father; and also a lofty abode called Vingolf, for the goddesses. The gods worked diligently, played at games, were rich in precious things, and happy until three maidens from Jötunheim, "giant's world," crossed the plain and entered Asaheim, when corruption began to spread among the inmates. *A.* had many mansions, the largest and noblest of which was Gladshheim, "home of gladness," while another not so large, but fairer and brighter than the sun, was called Gimli. The latter mansion will stand when heaven and earth shall have been destroyed by fire, and will be the dwelling-place of brave and upright men. There is a historical explanation of this myth: that Asaheim was a country east of the Don in Asia, where there was a city of Asgard in which ruled a chief named Odin, or Woden; that Odin, fearing subjection by the Romans, led his people across Russia to Sweden and settled at Sigtuna (Upsala); that his priests or chief men founded other settlements, and established the worship of their ancestors; that in lapse of time the man Odin and his chiefs came to be looked upon as gods. No date can be settled for such a migration; but from 120 to 80 B.C. has been thought probable, for then Mithridates Eupater was defying the armies of Rome. The Norse civilization and religion were undoubtedly of Aryan origin. See *Æsir*.

**ASGILL, JOHN**, an eccentric English *littérateur*, b. about the middle of the 17th century. He studied for the bar, and at intervals during the whole of his checkered life transacted legal business in some form or other; but having early displayed a predilection for writing political pamphlets, he soon became involved, in spite of his cleverness, in serious pecuniary difficulties. Fortunately for him, parliament had just passed an act (1699) for the resumption of forfeited estates in Ireland, and commissioners were appointed to settle claims. A bright vision flitted across the mind of the much-harassed man. He sailed for the sister isle, and found the whole country wrangling in law-suits. His talents, and the favor of the commissioners, secured to him a lucrative practice; and he even acquired sufficient influence to obtain a seat in the Irish parliament. Some time, however, before taking possession of his seat, *A.* had published a most extraordinary pamphlet, entitled *An Argument proving that, according to the Covenant of Eternal Life revealed in the Scriptures, Man may be translated hence into that Eternal Life without passing through Death, although the Humane Nature of Christ himself could not thus be translated till he had passed through Death* (1700). Much to *A.*'s surprise, the public flew into a rage against this absurd production; the Irish parliament voted it a blasphemous libel, and the astonished author was expelled from the house after four days. In 1705, *A.* returned to England, and entered the English parliament as member for Bramber, in Sussex. But the fame of his unlucky pamphlet haunted him perpetually, and at last proved a Nemesis; for the English house, resolving to be not less virtuous than the Irish one, took up the treatise, condemned it to be burnt by the common hangman, as profane and blasphemous, and expelled *A.* on the 18th Dec., 1707. After this his circumstances rapidly grew worse, until at last he found something like peace in the King's Bench and the Fleet, between which two places his excursions were confined for the term of his natural life. Here he continued to practice professionally, and—for he never succeeded in overcoming this weakness—to indite innumerable pamphlets on political and theological topics. He d. in Nov., 1738.

**ASH, *Fraxinus***, a genus of trees belonging to the natural order *oleacea*, and distinguished by very imperfect flowers, in which the calyx is obsolete, and the corolla either wanting or 3 to 4-partite; the fruit is a *samara*, a seed-vessel foliaceous at the extremity. The leaves are deciduous, and are pinnate with a terminal leaflet. There are about fifty species, mostly natives of Europe and of North America.—The COMMON ASH (*F. excelsior*) grows wild in the middle and s. of Europe and n. of Asia. It is an undoubted native of Britain. The flowers are quite naked; the leaves have five or six pairs of leaflets. The flowers appear before the leaves in spring, and the tree is not covered with leaves until the season is far advanced, losing them again early in autumn. It is, however, a most beautiful and umbrageous tree, highly ornamental in parks; but in parks or hedgerows it is extremely injurious to the grass or crops immediately around it. It

risers to the height of 100 to 150 ft., generally with a smooth stem. The wood is white, tough, and hard, much valued by wheelwrights, cartwrights, coach-makers, joiners, and turners. It is also excellent for fuel. Sometimes it becomes irregular in the disposition of its fibres, and finely veined, and is then prized by cabinet-makers. The wood of the young trees is almost as valuable as that of the old. Indeed, the value of the timber is greatest in trees of which the growth has been rapid, as it exhibits the characteristic toughness in the highest degree. The A. prefers a loamy soil, but grows in almost any, and succeeds in situations too elevated or too exposed for most other trees. It has of late been extensively planted in elevated situations in some parts of the n. of Scotland, and there, in the more sheltered glens, it grows to a large size. Cultivation has produced and perpetuated a number of varieties, of which the most remarkable are the *weeping A.*, with boughs bent almost straight down to the ground; the *curl-leaved A.*, with dark-green wrinkled or curled leaves; and the *entire-leaved A.*, a very curious variety, with many or all of the leaves simple (not pinnated), which has been erroneously regarded by some botanists as a distinct species, and named *F. simplicifolia*, *F. heterophylla*, etc.—The *SMALL-LEAVED A.* (*F. parvifolia*) and the *LENTISK A.* (*F. lentiscifolia*) are both natives of the shores of the Mediterranean, and are very graceful and ornamental trees.—The *AMERICAN A.*, or *WHITE A.* (*F. americana*), is readily distinguished from the common A. by its lighter bark and paler green leaves. The flowers have a calyx, and the leaflets are shortly stalked and entire (those of the common A. being sessile and serrated). It is abundant in New Brunswick and Canada, but becomes rare to the s. of New Jersey. The trunk often rises more than 40 ft. undivided. The wood is used for the same purposes as that of the common A.—The *RED A.*, or *BLACK A.* (*F. pubescens*), is very similar, but of smaller size, and has a deep brown bark. It is most abundant in Pennsylvania, Maryland, and Virginia, especially in swampy ground.—The *BLACK A.*, or *WATER A.* of the New England states, New Brunswick, etc. (*F. sambucifolia*), is a large tree with buds of a deep blue color.—The *BLUE A.* of Ohio, Kentucky, Tennessee, etc. (*F. quadrangulata*), is also a large tree. The branches are quadrangular, the young shoots having on the angles four membranes which extend their whole length.—The *GREEN A.* (*F. juglandifolia*), readily recognized by the brilliant green of its young shoots, is chiefly found in the middle states; and the *CAROLINA A.* (*F. caroliniana*), remarkable for the great size of its leaflets, chiefly in the southern states. Besides these, North America produces a considerable number of other species or varieties. The wood of all of them is used for somewhat similar purposes to that of the common A.—In the s. of Europe grows the *MANNA A.*, or *FLOWERING A.* (*F. ornus*, called *ornus europaea* by some botanists), whose flowers have a 4-partite calyx, and four small yellowish-white petals. The tree has much resemblance to the common A. From it the substance called Manna (q.v.) is obtained by means of transverse incisions in the bark; but in very favorable situations, it flows spontaneously during the greatest heat of summer. Manna is chiefly collected in Calabria and Sicily. A nearly allied species, *F. rotundifolia*, a native of Greece and the Ionian islands, yields it also in perhaps equal quantity. The common A. is said sometimes to produce the same exudation in the same warm climates.

The *MOUNTAIN A.* is the Rowan Tree (q.v.), and belongs to a different natural order. Its resemblance to the A. is chiefly in its leaves.

The A. has a peculiar importance in Scandinavian mythology. The first man and woman formed were Ask and Embla (Ash and Elm). The court of the gods is represented in the Edda as held under an A., called Yggdrasil (q.v.). Connected, perhaps, with these traditions is the superstitious belief in A. twigs as a charm against witchcraft and magic.

**ASHANTI**, or **ASHANTEE**, a negro kingdom in western Africa, on the n. of the Gold coast, in lat. 6° to 8° n., and long. 0° to 3° w. It is mountainous, well watered, and healthy, except in the lower alluvial districts. The principal rivers are the Volta, Prah, and Assinie. Pop. 1,000,000, of whom a fifth are warriors. The land is extremely fertile, producing maize, millet, rice, yams, tobacco, sugar, cocoa, the pineapple, and other fine fruits, with gums, dyewoods, and timber. The principal exports are gold-dust and palm-oil, together with slaves. The natives are remarkable for their skill in certain articles of manufacture; their cottons are beautiful, as also their earthenware and sword-blades. The capital is Coomassie (q.v.).

The beginnings of the A. kingdom are obscure, but its traditions point to an emigration some hundreds of years ago from a region n. of the Kong mountains, probably caused by the spread of the Mohammedan empire of Timbuctoo. Our first positive glimpse of it is got in the year 1700, when Coomassie was made the capital by Osai Too-toe I., who conquered Akim, Assin, Gaman, Denkira, and other neighboring states, and became a sort of feudal sovereign over a large district. In their course of conquest over the Fantees, the Ashantis became involved in war with the British (1807-26), and were finally driven from the sea-coast. In 1873-74, in consequence of disputes arising in connection with the cession of the Dutch forts to Britain, they were again involved in a war with the same power; and an army under Sir Garnet Wolseley forced its way to the center of the kingdom. After a severe battle at Amoaful, and several days' fighting, Coomassie was taken, Feb. 4, 1874, and burned on the 6th, and, though the rainy season had set in, the army returned in safety to the coast. The people are sanguinary in dis-

position and in their religious ceremonies, but brave, and more intelligent than the races along the coast.

**ASHBORNE**, or **ASHBURN**, a market t. of Derbyshire, England, a short distance from the left bank of the Dove, in a fertile valley, amid beautiful scenery, 13 m. n.w. from Derby. The streets are pretty regular, the houses mostly of brick. The parish church of A. is supposed to have been erected in the 13th century. There are a grammar and a free school, and a number of well-endowed charities. There are manufactures of cotton and lace, and trade in malt and cheese. Pop. '71, 2088.

**ASHBOURNE**, a small t. in a rich district near the left bank of the river Dove, in the w. of Derbyshire. It lies on a steep south slope, with high hills on the north. It has a cruciform church, as old as the 13th c., with triplet lancet windows, which was restored in 1845 at the cost of £5000. Pop. in 1871, 2083, chiefly engaged in the cotton, lace, and iron manufacture, and in the cheese and malt trade. At A., in 1644, the parliamentary troops defeated those of Charles I.

**ASHBURTON**, a small t. in the s. of Devonshire. It mainly consists of two paved streets crossing each other. It has a church in the perpendicular style, with a tower 94 ft. high. The pop. in 1871 was 2335, employed in the mines, slate-quarries, and serge manufacture. Till 1868, A. returned one member to parliament.

**ASHBURTON**, Lord **ALEXANDER BARING**, b. in 1774, a younger son of Sir Francis Baring, bart., was, in early life, for many years commercially engaged in the United States and the Canadas, in the service of the great London mercantile house founded by his father. On the death of the latter, in 1810, he became the head of the firm of Baring Brothers & Co., and in 1812 was elected M.P. for Taunton. He represented that place, Callington, and Thetford, on the liberal interest, till 1831, and in 1832 was returned for North Essex as a moderate conservative. In the short administration of Sir Robert Peel (1834-35), he was president of the board of trade, and master of the mint, and was created baron A. by patent in April, 1835. This title had been conferred in April, 1782, on the celebrated lawyer, John Dunning, who had married Alexander Baring's aunt, and it became extinct on the death of his cousin, the second lord A., in 1823. In 1842, lord A.'s knowledge of business, and thorough acquaintance with American institutions, customs, and modes of thought, caused him to be appointed special ambassador to the United States, to settle the north-west boundary question; and other disputes, that then threatened to involve the two countries in war. In August of the same year, he concluded the famous treaty of Washington, commonly called the A. treaty, by which the frontier line between the state of Maine and Canada was definitively agreed to. By this treaty, seven twelfths of the disputed ground, and the British settlement of Madawaska, were given to the United States, and only five twelfths of the ground to Britain; but it secured a better military frontier to England, and included heights commanding the St. Lawrence, which the award of the king of Holland, who had been chosen arbiter, had assigned to the Americans. By the 8th and 9th articles, provisions are made for putting an end to the African slave-trade; and the 10th article provides for the mutual extradition of suspected criminals. Lord A. opposed free-trade, but strongly supported the penny-postage system when first proposed by Rowland Hill in 1837. He formed a valuable collection of old paintings. His death took place May 13, 1848.—His eldest son, William Bingham Baring, second lord A. of this creation, b. in 1799, and educated at Oriel College, Oxford, entered parliament in 1836, as member for Taunton, and in Sept., 1841, was appointed secretary to the board of control. In Feb., 1845, he became paymaster-general of the forces, and treasurer of the navy. In 1855 he was made commander of the legion of honor, and in 1860 he was president of the geographical society. He d. in 1864.

**ASHBY-DE-LA-ZOUCH**, a small t. near the source of the Mease, a tributary of the Trent, in the n.w. of Leicestershire. Pop. in 1871, 7302. Leather-making is the principal manufacture, but nail-making, malting, wool-stapling, iron-smelting, and the manufactures of stockings, hats, and fire-bricks are carried on. In the neighborhood are collieries, and saline springs containing common salt in greater proportion than the sea; and ironstone, limestone, and fine clay are found. A canal 30 m. long, without a lock, connects the t. with Coventry. The ruins of A. castle stand on a height on the s. side of the town. Mary, queen of Scots, was once confined in this castle. St. Helen's church, an ancient structure with a tower, is the burying-place of the Hastings family, as well as of Selina, countess of Huntingdon, the founder of the sect called the Countess of Huntingdon's Connection.

**ASHBY, TURNER**, a confederate officer in the rebellion, celebrated as a leader of cavalry. He was made a brigadier-general in 1862, and was killed in June of that year in an engagement near Harrisonburg, Va.

**ASH'DOD**. See AZOTUS.

**ASHE**, a co. in n.w. North Carolina, bordering on Tennessee and Virginia; 300 sq. m.; pop. '70, 9573—582 colored. A mountainous region, good for grazing, but not for crops. Co. seat, Jefferson.

**ASHE, JOHN**, 1721-81; an American general in the revolution; b. England, came to America 1727. He was a representative in the North Carolina colonial assembly, and pre-

siding officer for three years. It is said that he was the first man to suggest the provincial congress, of which he was a prominent member. He joined the army early in the war, and led a force, in 1775, to take fort Johnson. He was with gen. Lincoln in 1779, and was defeated by Prevost at Briar Creek. In 1781 he was a prisoner of war, but on parole.

ASHER, the eleventh of Jacob's sons and the third by Zilpah, Leah's handmaid; founder of one of the twelve tribes of Israel. His birth is assigned to 1914 B.C. Gad was A.'s full brother. When they left Egypt the tribe of A. was the ninth in strength, numbering 41,500; when they entered Canaan they had increased by 11,900, and become fifth in size. Their geographical position was along the sea-shore from Carmel, with Manasseh on the s., Zebulon and Issachar on the s.e., and Naphtali on the n.e. The tribe had become unimportant in the time of David, perhaps dispersed among the Sidonians whom they could not subdue. Asher had four sons and one daughter.

ASHES, the remains of animal and vegetable bodies after burning. It is not strictly correct to speak of the ashes of a mineral. When lead, for instance, is exposed to heat, it turns to dross, which has the appearance of A., but is merely the lead combined with oxygen. In the same way, volcanic A., as they are called, are only a finer kind of pumice-stone, the solidified scum of molten lava. The ashes of organic substances destroyed by fire consist of the fixed salts contained in these substances. In land-plants, the most important are salts of potash, along with silica and lime; in sea-plants, soda takes the place of potash. By lixiviation of the A., the potash or soda is dissolved and separated from the insoluble mass, and is then purified by crystallization. The A. of sea-plants contain also more or less iodine. Peat and turf ashes contain, besides alkalis, more or less clay and sand; the same is true of pit-coal, which sometimes contains iron.

At one time, the A. or inorganic ingredients of plants were considered unessential to their existence. But the progress of vegetable chemistry has taught that a certain proportion of saline food is absolutely necessary to the development of plants. The analysis of the A. of the different kinds of vegetable substances has since become of great interest.

The A. of animal bodies do not differ greatly from those of vegetables. Bone-A. consist essentially of lime united with phosphoric acid. This bone-earth is very valuable as manure for grain. In well-wooded countries, A. from burnt wood form an article of considerable trade. They are much used in the arts, as soap-boiling, bleaching, dyeing, glass-making, etc. Wood-A. are also used in washing and other domestic processes as a cheap preparation of potash (q.v.).

The covering of the head with A. has long been a common sign of mourning among eastern nations, indicative of the very deepest distress. Instances of this are mentioned in Scripture. Penitents in the early Christian church signified their sorrow and humiliation in like manner, by standing at the door of the church in "sackcloth and ashes." See ASH-WEDNESDAY.

ASHFORD, a small t. on the w. of the confluence of the two upper branches of the river Stour, near the middle of Kent. Pop. in '71, 8458, which has largely increased from its having become the junction station of three great lines of railway. Damask is manufactured here.

ASHIKAGA, a line of military rulers (sho-guns, or "tycoons"), or lieutenants of the mikado, who ruled Japan, 1335-1573, the last being overthrown by Ota Nobunaga. Under the A., feudalism was developed in great splendor and complexity, and the custom of wearing two swords became general among the military class. One of the A. accepted the title of Nihon-o (king of Japan), from the emperor of China, thereby earning the execration of posterity, and giving rise to the impression among European writers that Japan was tributary to China.

ASHLAND, a co. in n.e. Ohio, intersected by the Atlantic and Great Western, and the Pittsburgh, Fort Wayne, and Chicago railroads; 390 sq.m.; pop. '70, 21,933. The surface is hilly, but the soil is remarkably fertile in grain, and well-suited to cattle-raising and dairy products. Co. seat, Ashland.

ASHLAND, a co. in n.w. Wisconsin, on lake Superior; intersected by the Wisconsin Central railroad; 2150 sq.m.; pop. '75, 730. Iron ore is found, and there is a ridge, 1200 ft. high, called Iron mountain. Co. seat, Ashland.

ASHLAND, a t. in Schuylkill co., Penn., in the coal region, 13 m. from Pottsville, on a branch of the Philadelphia and Reading railroad. Its people are largely interested in the coal business. Pop. '70, 5714.

ASHLAND, a t., the co. seat of Ashland co., Ohio, on the Atlantic and Great Western railroad, 85 m. n.e. from Columbus. It has miscellaneous manufactures and local trade. Pop. '80, 3000.

ASHLAR, or ASHLER, building-stone squared and hewn, as distinguished from rubble, or rough stones which are used as they come from the quarry without being dressed. A. is laid in regular courses in building, and is of various kinds, according to the style of working that side of the stone which is to form the facing of the wall. Thus, there are *tooled* A.—the marks of the tooling being either *random* or in *grooves*; *polished* A., in

which the face of the stone is rubbed smooth; and *rustic* A., in which only the joints are accurately hewn, the face of the stone being left projecting irregularly. Quarriers apply the term A. to squared stones before being hewn. In old documents the term appears under a variety of forms, such as achlere, ashelar, aslure, and estlar.

ASHLEY, a co. in s.e. Arkansas, bordering on Louisiana; 860 sq.m.; pop. '70, 8045—2764 colored. Corn and cotton are the staples. Co. seat, Hamburg.

ASHLEY, LORD. See SHAFTESBURY.

ASHMOLE, ELIAS, a celebrated antiquary, was b. at Lichfield on the 23d May, 1617. In 1633, when only 16 years of age, he commenced the study of law, and five years after, he was admitted to practice as a solicitor in chancery. During the civil wars, he embraced the side of the royalists, and was appointed captain in lord Ashley's regiment, and comptroller of the ordnance; but at the same time exhibited his love of study by joining Brazenose college, Oxford, where he sedulously applied himself to mathematics, natural philosophy, astronomy, and astrology. In 1646, he became acquainted with several famous astrologers; amongst others, William Lilly, whose conversation had a great charm for him; and in 1650, he published a work of Dr. Dee's, to which he subjoined a treatise of his own. Continuing with singular perseverance his researches in this dim region of superstitious philosophy, he was enabled, in the course of two or three years, to issue his *Theatrum Chymicum Britannicum*, which procured for him a high reputation, and the friendship even of men like John Selden. In 1658, appeared his *Way to Bliss*, a work on the philosopher's stone—the last he published in connection with astrology. At the restoration of king Charles various honors and emoluments were conferred upon him. In 1683, he presented to the university of Oxford a very fine collection of rarities, which properly, however, belonged to certain persons of the name of Tradescant. In this transaction he exhibited a rather mean ambition to exclude the rightful owners of the cabinet of curiosities from participating in the honor of the gift, and posterity has unfortunately gratified his wish by calling it the Ashmolean museum. He d. May 18, 1692, leaving behind him a large quantity of MS., a considerable portion of which has since been published.

ASHMUN, JEHUDI, an American philanthropist, was b. at Champlain, in the state of New York, in 1794. He was educated with a view to the Christian ministry; but eventually became editor, in Washington, of a monthly magazine called *The Repository*. In this periodical he advocated the views of the African Colonization society for founding a colony of liberated negroes on the west coast of Africa. In 1821, he published a life of the Rev. Samuel Bacon, who had fallen a victim to an unsuccessful attempt to realize these views in the previous year. Learning the difficulties which surrounded a second attempt at planting a settlement in Africa, A. resolved to devote himself to the good work. Receiving an appointment as one of the agents of the African Colonization society, he conducted a body of liberated negroes from Baltimore, and landed at cape Mesurado, the seat of the infant colony, in the autumn of 1822. Dr. Ayres and the other agents of the society having meanwhile abandoned the settlement from severe illness, he assumed the superintendence of affairs as the sole representative of that body. Here, for more than six years, he devoted his powers and his life to the establishing, on a fair and solid basis, this colony, so full of hope for the American negro. He showed great courage and tact in opposing the united forces of the natives at the outset of his management, and no less ability in after-negotiations with the chiefs by which the colony acquired very considerable accessions to its territory. His health at length becoming sadly impaired, he bade adieu to the settlement, then recently called Liberia, in Mar., 1828, and landed at New Haven, Conn., in a state of great exhaustion. After a brief revival, he relapsed, and d. on the 28th Aug., 1828, in his 35th year. His remains were honored with a public funeral. A memoir of his life, by R. R. Gurley, appeared at Washington in 1835.

ASHTABULA, a co. in n.e. Ohio, on lake Erie; intersected by the Lake Shore and Michigan Southern, and the Ashtabula, Youngstown and Pittsburgh railroads, 720 sq.m.; pop. '70, 32,517. It is drained by the Conneaut and Grand rivers; is level, and adapted to grazing. Among the minerals is a grit useful for grindstones. Co. seat, Jefferson.

ASHTABULA, a rapidly increasing town of the state of Ohio, North America, on the Cleveland and Erie railway, 3 m. from lake Erie, and 49 m. n.e. from Cleveland. It stands on a river of the same name, which flows into Lake Erie, and at the mouth of which there is a harbor. It is a place of considerable trade. Pop. '80, 4444.

ASHTAROTH. See ASTARTE.

ASHTON-IN-MAKERFIELD, a small township in a carboniferous district, in the middle of south Lancashire. Pop. in '71, 7463, chiefly engaged in collieries, and in the cotton manufacture.

ASHTON-UNDER-LINE, a t. in the s.e. of Lancashire. Pop. in '71, 37,389. It returns one member to parliament. It is a great seat of the cotton manufacture. The population is also employed in bleaching, dyeing, and calico-printing, in collieries, and in the manufacture of machines, bricks, etc. To the w. of the t. is a large moss or

shaking bog, containing fir-trees full of turpentine, and black oak, with a loamy bottom at the depth of 10 feet.

**ASH-WEDNESDAY**, the first day of Lent (q.v.), so called from the Roman Catholic ceremony of strewing ashes on the head as a sign of penitence. This custom, probably introduced by Gregory the Great (590-604), was sanctioned by pope Celestin III. in 1191, and afterwards generally prevailed. Before mass, the ashes were consecrated on the altar, sprinkled with holy water, and signed three times with the cross, while the priest recited the words, *Memento quod cinis es, et in cinerem reverteris!* ("Remember that thou art dust, and must return to dust!") Next, they were strewed on the heads of the officiating priests, the clergy, and the assembled people. The ashes were said to be those of the palms consecrated on the preceding Palm Sunday (q.v.).—The Protestant church in Germany does not celebrate A. In the church of England, it is observed by the stricter members, but without anything of the ceremony from which it derives its name; and the *commination*—a series of denunciations against impenitent offenders—is appointed to be read in the service for this day.

**ASIA**, the largest division of land on the globe, generally regarded as the birthplace of the human race, and the most ancient seat of civilization. Its superficial area, including islands, has been estimated at from 16 to 20,000,000 sq.m., and its pop. at 800,000,000. This enormous mass of continent lies almost entirely in the northern division of the eastern hemisphere, while its world of islands extends across the equator on the south-east. On three sides, it is surrounded by the ocean; but on the w., is partially connected with Africa and Europe. The continental mass is more than four times as large as Europe. Some idea may be formed of its vast extent by the calculation that, though it contains more than half of the whole population of the globe, the number of its inhabitants is so small compared with its area, that Europe may be said to be three times more densely populated. The coast-line is about 83,000 m. in length; and on the s. and e., is diversified by seas, bays, and gulfs, affording advantages to navigation and commerce far superior to those of Africa, but inferior to those possessed by Europe and America. On the w. side, the Dardanelles and the sea of Marmora may be regarded as but a slight interruption of the great table-lands of Europe and A. which form the continent of the old world.

*Horizontal Configuration.*—A. is bounded n., by the Arctic ocean; e., by the Pacific ocean; s., by the Indian ocean; and on the w., by Europe, the Black sea, Archipelago, Mediterranean, and the Red sea. On the extreme n.e., the peninsular land of Kamtchatka is separated from North America only by the narrow Behring's strait. On the s.e., a bridge of numerous islands—Sumatra, Java, Borneo, Papua, etc.—extends towards Australia. The body of the continent may be regarded as a trapezium, of which the offsets, consisting of several large peninsulas, bear some resemblance to those of Europe; though in A. everything is on a more gigantic scale. Thus, one of these offsets, the peninsula of Arabia, is four times as large as France. On the w. extends the peninsula of A. Minor, or Anatolia, divided from Europe by the strait of Constantinople, the sea of Marmora, and the Dardanelles, with the Black sea on the n., and the Levant on the south. On the s. of A., the peninsular configuration may be divided into three principal masses, corresponding to the southern coast of Europe: Arabia may be considered as a counterpart to Spain; Italy, with its neighbor-island, Sicily, is represented by Hindustan and Ceylon; and, as in Europe, the broken Grecian peninsula is connected with A. by a bridge of numerous islands extending on the s.e., so, in A., the eastern peninsula (or India beyond the Ganges), lying between the bay of Bengal and the Chinese sea, is connected with Australia on the s.e. by the vast Eastern archipelago. This world of islands is divided into the several groups of the Philippine islands, Borneo, Celebes, Molucca islands, Sumatra, and Java, Timor, and the numerous adjoining isles. The e. coast of A. is characterized by the deep indentations of the Pacific ocean in the Chinese sea, Yellow sea, and seas of Japan, Okhotsk, and Kamtchatka; all fringed with numerous islands, and separated by the peninsula of Corea, the island of Saghalien, and the peninsula of Kamtchatka. On the n., the Siberian coasts are also deeply indented; but rather by the embouchures of large rivers than by arms of the sea. The whole length of continental A., from the Dardanelles to the Japan islands, is 6000 m.; its breadth, from Malacca to the n.e. cape of Siberia, is 5300 m.; with its islands it extends from 10° s. lat. to 78° n., and from 26° e. long. to 190° e. or 170° w. Such an extent of surface must include all varieties of soil, climate, and production.

*Vertical Configuration.*—Equally grand are the features of this continent when regarded vertically: it has the most extensive lowlands, the most immense table-lands, the highest chains of mountains, and the most elevated summits in the world; tracts doomed to everlasting snow or scorching sterility, salubrious valleys of continual verdure, and noisome jungles of the rankest growth. The table-lands of Asia occupy two fifths of the whole continent. The eastern extremity is 2000 m. broad; the western, less than 1000. The whole mass may be regarded as consisting of two parts, separated, or, to speak more properly, perhaps, connected by the lofty, snow-covered mountain-isthmus of the Hindu Kush. These great divisions are styled respectively: 1. The eastern plateau, including the table-land of Tibet and the desert of Gobi; 2. The western plateau,

or table-land of Iran. The former, a vast four-sided mass, considerably larger than the whole area of Europe, extends 2800 m. from the mountain chain, Hindu Kush, to the Tonquin gulf in China. On the s., the plateau is divided from the plains of Hindustan by the Himalaya mountains, which have a mean height of 18,000 ft., while several of their summits rise from 25,000 to 29,000 ft. above the level of the sea. Even the passes over this enormous range of mountains are almost as high as the summit of Mt. Blanc. Here Dhwagiri, long supposed to be the Mt. Blanc of the Himalayas, and with precisely the same signification, viz., "white mountain," rising to 26,826 ft., leaves all the peaks of the Andes far below: while Kunchinjunga reaches to 28,156 ft., and Mt. Everest, now believed to be the loftiest summit in the world, attains the height of 29,002 ft. Cultivation is found at 10,000 ft. above the sea; while flocks graze some 4000 ft. higher. In eastern Tartary and Tibet, the ground is cultivated at a height only 2000 ft. lower than the summit of Mt. Blanc. On the e., the table-land of Tibet is bounded by the Chinese mountain-ranges Yun-ling and Khing-khan, which, towards the s., are connected with wild Chinese alpine regions of which little is known; while towards the n., they extend into another mountainous region, where the eastern chain of Shangpe-shan opposes to the Pacific ocean a wall of rock 3000 ft. high. On the n., the chain of the Altaï mountains, 3000 m. long, and divided into several groups, forms the boundary between the great plateau and the plain of Siberia, which is larger than the whole area of Europe.

The western plateau, or table-land of Iran, rises generally about 5000 ft. above the sea; but in some parts to 7000 ft.; descending again, however, in the central and southern parts, where it spreads out into sandy and gravelly plains, to 2000 and 1200 ft. It has been divided into three sections: the plateau of Iran proper; the Median-Armenian alpine region; and the Anatolian table-land. The first division, or the plateau of Iran, has a mean altitude of about 3000 ft. Salt plains, with gravel and sand, form large portions of the surface, and mountain-walls on all sides hem it in. On the northern edge ascend the Persian mountains; on the e., the steep and lofty parallel chains of the Indo-Persian boundary mountains; and on the s., the plateau, for 1000 m. along the Persian gulf and Arabian sea, is bounded by the wild terraced regions of Beloochistan and Farsistan. The second division, or the Median-Armenian alpine region, includes the mountainous regions of Armenia, Kurdistan, and Azerbaijan. Here the table-land is compressed to about half its general width. From this plateau, of which a part is mentioned in Scripture as "the mountains of Ararat," rises the volcanic cone commonly styled Mt. Ararat, to the height of 17,212 ft. above the sea level. Anatolia, the third and most westerly division of the table-land, is bounded along the shores of the Black sea by mountains rising to 6000 or 7000 ft., and partly covered with forests; on the s.w., the Taurus chain of mountains beginning in the islands of Rhodes, Cos, etc., extends in several ramifications through a part of Asia Minor, runs in a single range along the coast of Karamania, and in the e. has an occasional height of 12,000 and 13,000 ft.

The western plateau, thus divided into three sections, is full of diversities of soil and scenery. A great part of the table-land of Iran (or Persia) is extremely barren and arid; which serves to explain the enthusiastic terms in which the Persian poets have spoken of the beautiful valleys found here and there among the mountains. The coasts of the Persian gulf are sandy wastes. Between Irak and Khorassan, a desert of clay, covered with salt and nitre, varied only by patches of verdure here and there, occupies 27,000 sq. m., and joins the wide sandy desert of Kerman. A great part of Beloochistan is an arid plain, covered with red sand.

Besides these central masses, there are several detached mountain chains and plateaus. The Ural mountains, forming the land-boundary between Europe and Asia, and separated from the Altaï chain by salt lakes, marshes, and deserts, are divided into three sections: the northern, central, and southern Ural. The second of these divisions is rich in minerals—gold, platina, magnetic iron, and copper. On the isthmus between the Black sea and the Caspian, the alpine ridges of the Caucasus reach a height of from 10,000 to 11,000 ft., while individual peaks tower up to the gigantic height of 17,000 or 18,000 ft., as, in the still faintly volcanic peak of Elbruz (18,493 ft.) and Kasbeck (16,523)—both, however, on the northern or European side of the main mass of the Caucasus. The high lands of Syria rise gradually from the neighboring deserts to the height of 10,000 ft. in Libanus and Antilibanus, and slope steeply in terraces down to the narrow coast-lands of Phœnicia and Palestine. The plateau of the Deccan, in India, rises to an average height of from 1500 to 2000 ft., and is divided on the w. from the narrow coast-level of Malabar by the western Ghauts, 4700 ft.; on the e., from the broad level coast of Coromandel, by the eastern Ghauts. On the n., it is divided from the low plains of Hindustan by the Vindhya and Malwah mountain chains; and, on the s., the Ghauts unite at the sources of the Cavery, and form the Neilgherry (or Blue mountains, 8760 ft. high), the loftiest in the peninsular portion of Hindustan. These slope steeply down to a low narrow plain, then rise again to a considerable height in the Aligherry range, sink into the sea at cape Comorin, and reappear in the group of Adam's Peak in Ceylon. The Malayan mountains, or chains of the eastern peninsula, may be regarded as offsets of the Siue-shan, and extend to the extreme s. point of A., reappearing with volcanic peaks in the Sunda islands.

The six great Lowlands of A. are, 1st, The *Siberian* lowland in the n., which is by far the largest. It stretches from the northern declivities of the Altaï and Ural mount-

ains to the shores of the Arctic sea, and is, for the most part, cold, gloomy, and barren. 2d, The *Bucharian* lowland, or the wild sterile waste between the Caspian sea and lake Aral, much of it beneath the level of the sea. It is composed to a large extent of gravelly soil. 3d, The *Syrian and Arabian* lowland, the s. of which is hot and arid, with almost no oases; but the n. is watered by the Tigris and Euphrates. 4th, The lowlands of *Hindustan*, comprising the great Indian desert, 400 m. broad, together with the vast and fertile plains of Bengal, generally called the valley of the Ganges, and ranking, perhaps, next to China as a region of fertility. 5th, The *Indo-Chinese* lowlands, comprising the long levels of the Burman empire, through which flows the Irrawaddy, and the rich regions of Cambodia and Siam. 6th, The *Chinese* lowlands, commencing in the e. at Peking, and extending as far s. as the tropic of Cancer, containing 210,000 sq.m., or an area seven times the size of Lombardy. It is watered by a copious river system and numerous canals, and may be regarded as a vast garden, exceeding in productiveness all other parts of the world.

*Hydrography.*—The hydrography of A. displays as striking a variety as the structure of its land. The alpine regions send down in some directions torrents of water, which form rivers almost rivaling in magnificence those of America, and which flow for hundreds of miles through plains of unsurpassed fertility. On the other hand, there are wide stretching tracts, like the deserts of Africa, destitute of water, and doomed to eternal sterility. Only one large sheet of water, lake Hamoon or Seistan (q.v.), refreshes the high table-land of Iran. The low steppe of Turan contains the Caspian sea (q.v.), the largest of all lakes, and lake Aral (q.v.). In the valley of Cashmere lies lake Ular, 40 m. in circumference, and the only considerable sheet of water in the Himalaya chain. At the northern base of this mountain-chain lake Palte is remarkable for its annular form. In Thibet and the Altai mountains, lakes are very numerous.

One of the most striking characteristics of Asian river-systems is found in its double rivers, or two streams rising in the same region, flowing in almost parallel directions, and either uniting, or nearly so, before entering the sea. Among these twin rivers may be mentioned—the Syr-Daria and Amu-Daria, flowing into lake Aral; the Euphrates and Tigris, in western A., surrounding the plain of Mesopotamia, uniting at Koona, and together flowing into the Persian gulf; the Ganges and Brahmaputra; and the Yang-tze-kiang and Hoang-ho, in China, rising near each other, then widely separated in their courses, but again approaching each other, and both falling into the Yellow sea, only 100 miles apart.

The six great river-systems of A., comprising rivers which will be found fully noticed under their respective names, are—the Mesopotamian, that of north-west India, that of north-east India and Thibet, the Indo-Chinese, the Chinese, and the Siberian. The *first* comprises the two famous streams, the Tigris and Euphrates. The *second* comprises the Indus with its tributaries. The *third* system comprises the Brahmaputra and Ganges. The *fourth* system comprises the rivers of the Indo-Chinese peninsula; the chief of which are the Irrawaddy, the Martaban or Saluen, the Me-nam, and the Me-king or Cambodia. The *fifth* system is the Chinese. It comprises four great streams, all of which flow in an eastern or north-eastern direction into the Pacific; the Hong-kiang, or Canton river; the Yang-tze-kiang (or Son of the Sea); the Hoang-ho, or Yellow river; and the Amur. The *sixth* system comprises the large rivers of Siberia, the principal of which are the Obi, the Yenisei, and the Lena. They all have their sources in the Altaian mountains; flow n. or nearly so; and for 800 or 900 m. before their embouchure, traverse a dreary, flat, monotonous waste, until their sluggish waters creep into the Frozen sea.

*Geology.*—The geographical structure of A. is so complex, the different formations are so broken up and scattered, that a general description would be unintelligible. We must refer to separate notices, where the geological structure and phenomena of circumscribed districts will be given in detail, and the reader will, in this way, be enabled to form a correct impression of the geology of Asia as a whole. See INDIA, CHINA, THIBET, etc.

*Natural History.*—The vast extent of A., and its great diversities of climate, naturally lead us to expect in it a great variety of natural productions, both animal and vegetable. This expectation is heightened when we consider how completely this vast continent is divided into separate portions by mountain ranges of great altitude, and how extensive the mountainous tracts themselves are, as well as the great extent of the elevated plateaux or table-lands, and when we add to these considerations that of the peculiar character of wide regions—wastes of sand—level steppes—and extensive districts of which the soil is strongly impregnated with salt. Accordingly, we find, both in the flora and fauna of Asia, all the variety which such considerations might lead us to expect.

The most northerly part of the continent, however, differs comparatively little in its productions from the corresponding parts of Europe and America. It exhibits the same arctic flora, with differences comparatively inconsiderable. Pines, birches, and willows form, as in the other continents, the last forests of the n.; but upon account of the more severe climate, they do not reach a limit so northerly as in Europe, and particularly in the w. of Europe. Some of the common plants of Europe are abundant as far e. as Kamchatka: the crowberry (*empetrum nigrum*), so plentiful in the moors of Scotland, is still more plentiful throughout Siberia; the same *vaccinia* (bilberries, etc.) and *rubi* (brambles, etc.) abound in the Kamchatkan forests as in those of Scandinavia. There

are, however, interesting differences. Heaths are comparatively rare in Asia, its flora agreeing in this respect with that of America, rather than with that of Europe. The larch, which in Europe occurs only on the central mountains, extends far northward at the mouth of the Obi to the utmost limits of arborescent vegetation; probably a mere variety of the same species, although it has been described as distinct. In Kamitchatka, a different kind of birch replaces the common birch of Europe as a forest tree, and the Siberian stone pine is different from that of the s. of Europe. Siberia in its less frigid regions produces a luxuriant vegetation, of which herbaceous plants of unusually large size for a cold or temperate climate are a characteristic feature; as species of rhubarb, angelica, and cow-parsnip (*heracleum*), some of which are now well known in Britain. It is indeed from the central and eastern temperate parts of Asia that the cultivated species of rhubarb are derived, and from the same region the rhubarb root, so valuable in medicine, is brought. In the abundance of *grossulariaceæ* (currants), the warmer parts of Siberia resemble North America, although most of the species are different.

To the s. of the Altai mountains, the flora of Asia corresponds in part with that of the great eastern plain of Europe; but it exhibits also peculiarities which may in some measure be ascribed to the saline character of large districts, the stony or sandy desolation of others, and the elevation of the great central plateau. The flora of Asia Minor and of Syria has a general resemblance to that of the s. of Europe, although exhibiting also features which belong rather to that of India or of Africa. Shrubby *labiate* are particularly characteristic of this region, from which not a few of them have found their way into the gardens of Europe and of other parts of the world, upon account of their fragrance, their medicinal qualities, or their use for the grateful seasoning of food. The tropical flora of Arabia abounds in trees which yield fragrant balsams and resins, particularly of the natural order *amyridaceæ*. Indeed, both the warmer temperate and the tropical regions of Asia excel other parts of the world in the number and variety of the odoriferous drugs which they produce, with odors of the most various characters, from myrrh and frankincense to asafoetida. Arabia has long been noted for the production of coffee, which is now also pretty extensively cultivated in other warm parts of A. The date-palm is as characteristic of Arabia as it is of Egypt. Acacias and mimosas also abound.—The flora of Persia in part resembles that of Arabia, although it is less tropical, and the altitude of its mountains gives to it in some places an extremely different character. The abundance of *scitamineæ* is regarded as particularly characteristic of India; and plants of this order yield ginger, galangal, cardamoms, turmeric, and other articles of commerce, amongst which not the least important is a kind of arrowroot. Its *leguminosæ* are also very numerous, both herbaceous and shrubby, or arborescent, many of them exhibiting great beauty of foliage and splendor of flowers; some producing useful kinds of pulse; others timber, gum, medicines, etc. The number of valuable medicinal plants which belong to the Indian flora is very great, as is also that of dyewoods; and it abounds in fine fruits, of which the mango and mangosteen may be particularly noticed. *Cucurbitaceæ* (gourds) are very numerous; as are also trees of the genus *ficus* (fig), some of which produce caoutchouc, and amongst which are the sacred peepul and the banian-tree, so remarkable for the roots which descend from its branches to become new stems, and for the extent of ground which it canopies. Palms are numerous in the tropical parts of A., and particularly in its south-eastern regions, but less numerous than in the tropical parts of South America. The cocoa-nut is one of the most common palms in the vicinity of the sea. Some of the Asiatic palms are valuable for the sago which they yield. The natural order *dipteraceæ* is one of those that are peculiar to India and south-eastern A., and includes some of the noblest timber-trees; but the Indian teak, so valuable for ship-building, is of the order *verbenaceæ*. The flora of the eastern peninsula, Siam, Cochin-China, and the south-eastern part of A. generally, differs considerably from that of India, and exhibits, if possible, a richer variety. The change from the Indian flora is still greater in the islands, and a resemblance to that of Polynesia and of Australia begins to appear. The bread-fruit takes the place of its congener, the jack of India. These regions produce nutmegs, cloves, and other spices. The *lauraceæ* are abundant, yielding cinnamon, cassia, and camphor. Gutta-percha has recently been added to the number of the most valuable exports. China and Japan have many plants peculiar to themselves, and are remarkable for the prevalence of the *ternstroemiaceæ*, the natural order to which the tea-plant and the camellia belong. It is scarcely necessary to mention how extensively tea is cultivated in China, and how important it is in the commerce of the world. The diversity of climate, however, both in China and Japan, is so considerable, as to imply no small diversity of productions. In like manner, the Himalaya mountains possess a flora very different from that of the Indian plains, and which in some of its most characteristic features, particularly in the prevalence of large rhododendrons and magnolias, has been found remarkably to agree with the flora of the southern parts of the United States; whilst at still greater altitudes there is a strong resemblance to that of more northern regions, or of the European Alps; forests of pines appear, and along with them the *deodar*, a cedar scarcely, if at all, different from the cedar of Lebanon. The mountains of Java also produce oaks and other trees resembling those of the temperate zone, although the species are peculiar. But many parts of A. have as yet been very imperfectly explored.

Many of the cultivated plants of Europe are known to be natives of A., and others

are supposed to be so. As the cradle of the human race, and the scene of the earliest civilization, it is natural to suppose that it supplied the first fruits and other vegetable productions which man sought to improve by cultivation; and of some which, as the apple and the cherry, are probably natives of Europe, it seems probable that the first improved varieties were introduced from A. We do not know with certainty of what part of the earth some of the principal cereal plants or grains are natives—as wheat, barley, oats, and rye; but there seems great probability in the supposition that they are of Asiatic origin. Rice certainly is. It has been cultivated from time immemorial in some of the warm parts of A.; and its introduction into other quarters of the world is comparatively recent. Maize—introduced from America—is now to be reckoned among the most important cultivated plants of A., and its cultivation is rapidly extending, as is that of the potato. Wheat, oats, barley, rye, beans, peas, and buckwheat, are the principal crops of regions similar in climate to those in which they are cultivated in Europe. Barley and buckwheat are cultivated in the Himalayas at the extraordinary elevation of almost 12,000 ft., and crops of barley are to be seen even at 15,000 ft. above the sea. Millet of different kinds, durra, and other grains of inferior importance, are cultivated to some extent in India and other warm regions; also different kinds of pulse. The banana and plantain are of the same importance as in other tropical countries; and the yam and coco or eddoes contribute largely to the supply of human food. The sugar-cane is cultivated in the warm parts of A., but not with so much spirit or success as in America, although it is a native of the East and not of the West Indies. Pepper is one of the native productions of the East Indies, and is extensively cultivated. Tobacco, whether or not any species of it is indigenous to A., is now produced in large quantities. Indigo is extensively cultivated in India, and the opium poppy too extensively. Different species of cotton are natives of India and have long been cultivated there and in China. Hemp is cultivated in India, not for its fiber but to afford the means of intoxication; and flax chiefly for the oil of its seeds; but both hemp and flax are extensively cultivated for their fibers in other parts of A.; and India and the other tropical regions produce many plants valuable for their fibers, among which are species of *musa*, *corchorus* (yielding the jute of commerce), and *urtica* (nettle). Among the crops of India is sesame, valued for the oil of its seeds.

It seems probable that we are indebted to the warmer temperate parts of A. not only for the orange, the lemon, and all the other species of the genus *citrus*, but also for the olive, the peach, and nectarine, the apricot, the fig, the mulberry, and the vine, with many other of the fruits now most generally esteemed and cultivated. China and Japan being the seats of an ancient civilization, many useful plants have long been cultivated there, which have scarcely yet found their way into other parts of the world. Floriculture has been practiced there with great assiduity from a remote antiquity; and varieties of hydrangea, camellia, tree peony, chrysanthemum, etc., have, from time immemorial, been scarcely, if at all, less numerous than those of the tulip and hyacinth in Holland.

The zoology of A. is not less interesting than its botany. Amongst domestic animals, the most important are the ox and buffalo, the sheep, the goat, the horse, the ass, the camel, and the elephant. A number of species of ox and buffalo are natives of A., from more than one of which the domesticated races appear to have derived their origin. Very distinct from all the others is the yak (q.v.) of Thibet, a creature which is of great use to the inhabitants of the elevated regions of the Himalayas, and is to them almost what the reindeer is to the Laplander. The sheep and goat are natives of the mountainous parts of central A. The horse and the ass seem to belong to the same regions; and all of these have been domesticated from the earliest times. The camel is of incalculable value as a beast of burden in the regions of heat and drought, and as affording the means of traversing the great deserts. It is used principally in the s.w. of A. and in India. The elephant is a native of the tropical parts of A., but is of a different species from that of Africa. The reindeer constitutes the chief wealth of some of the tribes of the n. Dogs are also used by some of the Siberian tribes for drawing their sledges. Different races of dogs are domesticated in different parts of A., and a small kind is fattened for its flesh in China; but in the Mohammedan parts of A., the dog is reckoned an unclean animal, and is known chiefly as a prowler about towns and villages, and a devourer of offal.

The tropical parts of A. abound in monkeys, of which the species are very numerous. Among them are some with long and some with short tails, but none with prehensile tails, like the sapajous of America. Many are altogether tailless, and among these is the orang-outang, found in the south-eastern islands. A much larger ape, called the pongo, has been said to exist in Borneo, but it is still a doubtful species. The same warm regions abound in bats, many of which are of large size, and feed upon fruits, not upon insects. The flying lemur or colugo is another remarkable animal of the Indian archipelago.—Bears are found in all parts of A.—the white bear in the extreme n., and other formidable species in the more temperate parts; whilst the tropical regions produce bears which are by no means ferocious, and feed chiefly on insects, fruits, and honey. Badgers are also found in A., and quadrupeds of several other plantigrade genera, allied to the bear, but of comparatively small size and inoffensive habits, as the beautiful panda (*ailurus*) of the n. of India, and the binturongs (*ictides*) of Malacca and the neighboring archipelago.—Animals of the weasel family (*mustelidae*) are numerous, among which the

teledu (*mydarus meliceps*) of Java rivals the skunks of America in the horrible stench with which it surrounds itself for defense. More important are the sable and the sea otter, pursued in the northern regions upon account of their furs.—Of the dog family, or *canidae*, A. has not only wild dogs, but also wolves, foxes, hyenas, and jackals; the two former abounding chiefly in the colder, the two latter in the warmer regions. The arctic fox inhabits the most northerly shores and islands. The warmer parts of A. produce a number of species of the allied family of the *viverridae*, among which are the mangouste or Indian ichneumon—famous, like the Egyptian ichneumon, for the destruction of serpents—and the civet, from which is obtained a celebrated perfume.—Of feline animals, the most dreadful are the lion and tiger; the latter of which is peculiar to A., abounding in the warm regions of the s. and e., never extending westward beyond the mountains and deserts which separate India from Persia; but, on the contrary, advancing far to the n., beyond the limits to which the lion advances, and even to the confines of Siberia. The leopard, the ounce, and many other cats, some of them large and dangerous, are found in A., especially in the warmer parts of it. Among them may be mentioned the chetah, or hunting-leopard, tamed for the chase in India.—A few small marsupial (or pouched) quadrupeds (*phalangers*) are found in the Moluccas, and form one of the links by which the natural history of A. is connected with that of Australia.—The *glîres* or *rodentia*, on the contrary, are numerous in all parts of A., and many species are peculiar to it. Squirrels, marmots, rats, mice, hares, etc., are common in all except the most northerly regions. The brown rat, now so common in Europe, is said to have emigrated from Persia so recently as the beginning of the 18th century. Lemmings abound in Siberia and the Tartarian deserts, of which the jerboa is also an inhabitant. Porcupines are frequent in the warmer parts of A., and the beaver is found in the n.—Of edentate quadrupeds, the pangolins (*manis*) alone are Asiatic, and these are confined to the tropical regions.—Of *pachydermata*, there are, besides the elephant, the horse, etc., already mentioned, several species of rhinoceros, wild boars, the babyroussa, and a species of tapir; all, except the wild boar, natives of the warmest climates. One of the most interesting facts, however, connected with the natural history of A., is the abundance of remains of the mammoth, or fossil elephant, in the coldest parts of Siberia, its tusks still affording a considerable supply of ivory.—Of ruminating animals, besides those of the ox kind, already mentioned, and the sheep and goat, there are deer, antelopes, and musks or musk-deer. The reindeer and elk are natives of Siberia; further s., the species of deer are much more numerous, and the same countries produce many species of antelope. The musks are found in the central and southern parts of the continent; one of them, a native of the highest mountains, yielding the much-prized perfume from which it derives its name.—A. possesses vultures, eagles, and other *falconide*, owls, ravens, and other birds of the crow kind, herons, storks, cranes, etc. Swans, geese, ducks of various species, and many other *anatide*, frequent its waters, some of them abounding even in the coldest regions. Albatrosses are very numerous on the Kamtchatkan shores; flamingoes on those of the more southern countries. Pigeons abound, and among them is the turtle-dove. The gouras of the Indian archipelago are birds of the pigeon family, of which one species is almost as large as a turkey. There are many kinds of thrush, finch, warbler, bunting, sparrow, and other birds identical with or allied to those of Europe, among which is the nightingale, often mentioned by the Persian poets, and many also, particularly in the warmer regions, which are peculiar and characteristic. Of these may be mentioned the splendid birds of paradise of the south-eastern islands, peacocks, pheasants, etc. The gallinaceous birds of A. are numerous, and from this continent were probably derived the domestic poultry of other parts of the earth. The abundance of the parrot tribe constitutes a point of resemblance between the tropical parts of A. and other tropical countries, but lories are peculiar to the East Indies. The ostrich inhabits the deserts of Arabia as well as of Africa. The cassowary is found in the south-eastern islands. The edible swallows' nests of the East Indian coasts have long been celebrated.—Lizards and other saurian reptiles are very abundant in the warmer parts of A.; and great crocodiles and gavials infest the rivers of the East Indies. Boas, pythons, and other great serpents are found in the tropical regions, which produce also many venomous serpents. The cobra da capello is one of the most dreaded. But the temperate parts of A. have also venomous serpents, scarcely less dangerous. Some of the East Indian tortoises are remarkable for their great magnitude, and turtles are found in the seas.—Both the salt and fresh waters of A. produce many kinds of fish. The *salmonide* of the rivers of Siberia supply an important part of the food of its inhabitants. The goldfish, now so well known in Britain, is a native of China. Some of the fish of the tropical parts of A. have attracted attention from the peculiarity of their form or habits. Insect life is exceedingly abundant in the warm parts of A., as in all other warm countries. Bees are numerous, and honey is produced in great quantities. Of other insects, it seems only necessary here to mention the silk-worm, which was introduced from A. into Europe; and the locust, which sometimes devastates great tracts of the Asiatic countries bordering on the Mediterranean and the Black sea, and occasionally extends its ravages into regions further w. Of molluscous animals, the pearl-oyster deserves particular notice, upon account of the important pearl-fisheries which exist in different places.

*Ethnography.*—The whole population, consisting of 800,000,000 people, may be divided

into the Mongolian, Aryan, and Semitic groups. The *first* of these includes all the peoples and tribes in the e., n., and s.e. of Asia; the *second* (see ARYAN RACE) embraces the inhabitants of northern India, Afghanistan, Persia, and part of Asiatic Turkey; the *third* includes the Syrian, Hebrew, and Arabian races (see ETHNOLOGY).

A further subdivision and classification may be made as follows: 1. The *East-Asian group*, including the peoples of Thibet, China, Japan, Corea, and the Indo-Chinese peninsula; all alike in the use of monosyllabic languages. This last people, however, must be subdivided into western and eastern, the former comprising the inhabitants of the Burman empire, Pegu, Laos, and Siam, having affinities with the Hindoos; and the latter, comprising the inhabitants of Tonquin, Cochinchina, and Cambodia, have affinities with the Mongolian of Thibet and China. 2. The *Tartar group*, including the Turcomans, Mongols, and Tungusians, who are spread over the whole table-land of central Asia and the neighboring lands in the n. The Turcoman family is divided into three sections—the first including the east Turcomans, inhabiting Tashkend, Khiva, Balkh, and Usbekistan; the second including the so-called Tartars of the Urals and the neighborhood of Astrakhan and Kazan; the third including the Turks or Osmanli. With the exception of a few small tribes in Siberia, all the Turkish varieties are Mohammedans, use the Arabic alphabet, and employ numerous Arabic words in their dialects. 3. The *Siberian group*, including the Samoiedes, people of Kamtchatka, etc., speaking languages which have only recently been studied by philologists. 4. The *Malay-Polynesian group*, mixed with Australasian negritos, are spread over all the islands of Polynesia and the Indian archipelago. The Malay people of Java, Sumatra, Celebes, the peninsula of Malacca, the Sunda islands, Moluccas, and Philippines, have an incipient literature, which has been formed under Moslem and (since the 16th c.) under European influence. The South sea islanders are clearly divided into two races by physical form, color, and language. One race is allied to the Australasian negrito, and the other to the Malayan. In most of the islands, there is a partial intermixture of the two races, but generally the distinction is obvious. It is probable that all the copper-colored Polynesians belong to the same family with the people of the Indian archipelago. 5. The *Deccan group*, including all the people employing the Tamul, Carnatic, Telugu, and Singalese languages, all having a certain measure of civilization and a literature. 6. The *Indo-Germanic or Aryan group*, marked and subdivided by the three languages, Sanscrit, Persian, and Armenian. About thirty distinct nations, each having a peculiar dialect and literature, belong to the first subdivision; the second includes the peoples of Beloochistan, Afghanistan, Persia, and Kurdistan; the third, the Armenians. All these families have literatures partly written in dead languages—the Sanscrit, Pali, Zend, and old Armenian. 7. The heterogeneous tribes inhabiting the Caucasus, whose affinities are not yet settled. 8. The *Semitic group*, including all the peoples whose languages are related to the Hebrew and Arabic.

*Religions.*—The same Asian characteristic of variety and wide contrast is found in the creeds as in the countries and tribes of people: the Brahminical religion of India; the doctrines of Buddha, Confucius, and of Lao-tse in China; the worship of the grand lama in Thibet; the creed of Islam in several varieties in Arabia, Persia, and India; the rude heathenism of the north; the various sects of native Christians in Armenia, Syria, Kurdistan, and India; the Greek church in Siberia; these and other forms of faith or religious profession display diversities and contrasts nearly as striking as those of Asian geography. Christianity, now the religion of Europe and America, owes its origin to Asia. For an account of the existing religious systems of Asia, see articles MOHAMMEDANISM, INDIA (*Religion*), BUDDHISM, LAMAISM, etc.

*Civilization.*—The number of people civilized—in the Asiatic sense of the word—is far greater than that of wild and nomadic hordes; but culture here, when arrived at a certain point, assumes a stationary character, widely differing from the restless intellectual activity and industrial progress of Europe. The laws of states, families, industry, commerce, art, and science are, in India and China, so many branches of one fixed and permanent religious system, which has maintained its sway through many centuries, and would long remain unchanged, if left undisturbed by European influence. The Arabs, Persians, and Turks, collectively known as the easterns, are distinct in civilization from the Hindoos and Chinese. The institution of slavery among the former, of *caste* among the Hindoos, and the civil and political equality of China, are distinguished marks. The Turk is a monotheist and fatalist; the Hindoo is either a mystical pantheist or polytheist, acknowledging a multitude of gods; the Chinese is rather a utilitarian moralist.

*Industry.*—The industry and commerce of the Asiatic continent bear no adequate proportion to its capabilities—such as they are, they will be described under the different countries.

*Political Aspect.*—The political institutions of A. present to us some striking contrasts. While the barbarous hordes in the n. live almost without the idea of government, and scarcely know that the Russian czar claims them as his subjects, and the nomadic tribes, under their khans or sheiks, have a sort of patriarchal government, subordinate to higher powers, the most extreme forms of monarchy and despotism have existed among the more cultivated nations. The government of China is an absolute monarchy in form, but, in fact, is strictly limited by the force of tradition. The emperor is apparently unlimited in authority; but it is an essential duty of an emperor to rule exactly according to the precepts handed down by his ancestors. Reverence for ancestors and

their institutions is, therefore, the sole presiding and conservative principle which has so long preserved the great Chinese empire from political changes. A., now so passive, anciently took an active part in the great movements of the world's history; contended against Egypt and Greece, and afterwards contributed to the greatness and glory of the Macedonian and Roman empires. From the n. of the Caspian sea came the vast hordes of the Huns, who spread themselves abroad over Europe. The armies of Genghis Khan and Tamerlane overran the Slavonian plains, while the Arab caliphs, with their fanatical troops, established their religion and government in three quarters of the world. Under the Osmanli fell the eastern Roman empire, and still the Turk maintains a political position in Europe, but one now becoming very feeble and insecure. In proportion as Europe has advanced, A. has declined in political power, so as to countenance the theory of a gradual movement of the spirit of civilization and progress from the eastern to the western world. So soon as the Asiatic nations have reached a certain moderate pitch of culture, the history of civilization ceases so far as they are concerned, and is followed by the mere chronology of states or dynasties. It would appear that all great future changes in the destinies of the peoples of Asia must proceed from European impulses. When Portuguese ships had rounded the cape and so reached India, a new era of Asian history began. The Portuguese, the Spaniards, Dutch, French, Danes, and English planted their standards on Indian soil. The English speedily extended their dominion here, and soon overshadowed all the other European powers; though the Portuguese and French still maintain their footing in Hindostan, and the French, the Spaniards, and the Dutch own large territories in Further India or the Indian archipelago. Lately England has increased her influence in the extreme w. of Asia, having secured the right to occupy Cyprus, while guaranteeing the defense of the Asiatic dominions of the porte. Meanwhile Russia has extended her sway over Siberia, Caucasus, and Turkestan; securing thus the keys of China and the approaches to Persia. Even in some of the nominally independent powers, European influence is very powerful; the throne of Persia, for example, is surrounded by European diplomatists. And while Russia and Britain are striving to share between them supremacy in Asia, the French and the Americans have a large share of the commerce of the eastern coasts.

The following table gives an approximate estimate of the area and population of A., according to the more important existing political divisions:

STATE.	Area in sq. miles.	Population.
<b>Chinese Empire:</b>		
China proper.....	1,530,000	405,000,000
Dependencies of Mantchuria, Mongolia, Tibet, Corea, etc.....	2,410,000	28,500,000
<b>Japan.....</b>	155,517	33,299,014
<b>Independent Arabia.....</b>	956,000	3,700,000
<b>Persia.....</b>	630,000	5,000,000
<b>Afghanistan.....</b>	275,000	4,000,000
<b>Kafiristan.....</b>	20,000	300,000
<b>Beloochistan.....</b>	105,500	1,000,000
<b>Independent Turkestan:</b>		
Turcoman territory.....	79,000	175,000
Khiva.....	32,000	700,000
Bokhara.....	83,000	2,286,000
Eastern Turkestan.....	427,000	580,000
Dzungaria.....	138,000	500,000
<b>Further India:</b>		
Anam.....	196,000	21,000,000
Burmah.....	190,000	4,000,000
Siam.....	305,000	5,750,000
Tribes s. of Assam.....	18,000	130,000
Cambodia.....	33,000	890,000
Independent Malacca.....	31,000	300,000
<b>Asiatic Turkey, including the Turkish possessions in Arabia.....</b>	742,000	13,171,000
<b>British Possessions in Asia.....</b>	920,797	193,743,476
Hindustan, immediate possessions.....	897,004	189,613,238
Native states more or less completely under English influence.....	589,315	50,325,457
Straits settlements.....	1,206	308,097
Hong-Kong.....	32	121,985
Labuan.....	45	4,898
Nicobar and Andaman islands.....	3,276	18,500
<b>Russian Possessions:</b>		
Caucasus (partly in Europe).....	172,170	4,893,332
Siberia.....	4,765,400	3,405,084
Central Asia.....	1,079,283	3,356,759
Ferghana (Khokand).....	23,160	960,000
<b>French Possessions:</b>		
Cochin China.....	21,632	1,526,867
French India (including Chandernagore, Karikal, Mahé, and Pondicherry).....	196	266,308
<b>Portuguese Possessions:</b>		
Goa, Salcete, Bardez, etc.....	1,300	474,234
Damao.....	30	40,980
Diu and Gogola.....	12	12,303
In Indian Archipelago.....	5,506	(?) 250,000
In China (Macao).....	1	71,834
<b>Dutch Possessions in the Indian Archipelago (Java, parts of Sumatra, Celebes, Borneo, etc.).....</b>	612,520	24,370,600

ASIA (*ante*). The area and population of A. are given in 1878, in the statistical work of Behm & Wagner, *Bevölkerung der Erde*, as follows:

DIVISIONS AND SUBDIVISIONS.	Area in sq. miles.		Population.	
	Division.	Subdiv.	Division.	Subdiv.
SIBERIA .....	4,824,500		3,440,362	
CENTRAL ASIA .....	1,524,500		7,510,876	
Russian Central Asia .....		1,305,300		4,505,876
Lake Aral .....		25,900		
Territory of the Turcomans .....		79,700		175,000
Khiva .....		22,300		700,000
Bokhara .....		84,000		2,030,000
Karategin .....		8,800		100,000
Kushgaria, Soongaria (with China) .....				
CASPIAN SEA, exclusive of islands .....	160,668			
WESTERN ASIA .....	2,022,760			
Caucasia .....		169,459	37,680,000	5,291,744
Turkey in Asia .....		743,486		17,880,000
Samos .....		213		35,878
Arabia (independent) .....		968,100		3,700,000
Aden (7.65 sq. m.) .....		8		22,707
Persia .....		636,000		6,000,000

ASIA, CENTRAL. This term is usually, in its geographical sense, used of the region lying between the Altai mountains and the Persian gulf, and includes part of Siberia, all Turkestan, Afghanistan, Beloochistan, and part of Persia. An earlier usage—that of Humboldt—gave this name to the khanates of Bokhara and independent Tartary. In Russian official language, central Asia is an administrative division of the empire lying to the s.w. of Siberia, and comprising, with part of what used to be called Siberia, the recent Russian annexations in Turkestan. Russian central Asia is divided into the governments of Akmollinsk, Semipalatinsk, Turgai, Uralsk, Semiretchensk, Syr-Daria, Sarefchan, Kuldja, Amu-Daria, the Trans-Caspian territory, and Ferghana. The total area is given at 1,227,000 sq. m., and the pop. 4,490,000.

ASIA GO, a t. of n. Italy, 22 m. n. from Vicenza. It stands on a ridge, among the southern spurs of the Alps. It is celebrated for the manufacture of straw-hats, and also for carpenter-work and turning. Pop. 5140. The surrounding district, known as the "seven communes," is well wooded, and abounds in sheep and cattle. See SETTÉ COMMUNI.

ASIA MINOR, the ancient name of what is now called Anatolia (q.v.). Here, in Ionia, was the early seat of Grecian civilization, and here were the countries of Phrygia, Lycia, Caria, Papiliagonia, Bithynia, Lydia, Pamphylia, Isauria, Cilicia, Galatia, Cappadocia, etc., with Troy, Ephesus, Smyrna, and many other great and famous cities. Here, from the obscure era of Semiramis (about 2000 years B.C.), to the time of Osman

(about 1300 A.D.), the greatest conquerors of the world contended for supremacy; and here took place the wars of the Medes and Persians with the Scythians; of the Greeks with the Persians; of the Romans with Mithridates and the Parthians; of the Arabs, Seljuks, Mongols, and Osmans with the weak Byzantine empire. It was here that Alexander the great and the Romans successively contended for the mastery of the civilized world. But, notwithstanding all these wars, the country still continued to enjoy some measure of prosperity till it fell into the hands of the Turks, under whose military despotism its ancient civilization has been sadly brought to ruin.

**ASIATIC SOCIETIES**, various associations for the study of the languages, antiquities, and history of the eastern continent. The Dutch founded one in Batavia, in 1780; the royal A. society of Bengal was founded at Calcutta in 1784 by Sir Wm. Jones. One at Paris dates from 1822; one in Great Britain, 1823; the A. society of Ceylon was formed in 1845; the German oriental the same year; the A. society of China in 1847; the American oriental society in 1842.

**ASINAI**S, an Indian tribe in Texas, called "Cenis" in La Salle's works. Missions were established among them by the Spaniards early in the 18th century. They were agriculturists, and lived in large circular cabins, of which some held a dozen or more families. As a tribe they have not been known since the 18th c., and seem to have been long extinct.

**ASINALUN'GA**, or SINA LONGA (anc. *Ad Meusulas*), a t. of Tuscany, n. Italy, in the province of Siena, 22 m. s.e. from Siena, on the Siena railway. It is beautifully situated on hills bordering the Val di Chiana, and is a well-built t., with wide and well-paved streets, and a handsome collegiate church, in which are many fine paintings. Pop. of commune, 8500.

**ASKEW**, or **ASCOUGH**, ANNE, one of the sufferers for Protestant opinions at the dawn of the reformation in England. Having embraced the views of the reformers, she was turned out-of-doors by her husband, a gentleman of Lincolnshire, and a zealous Roman Catholic. On this she went up to London to sue for a separation; but was eventually arrested on a charge of heresy, and was examined by the bishop of London and others on the doctrine of transubstantiation, the truth of which she denied. After further examination and torture by the rack, she was burned at the stake, in Smithfield, July 16, 1546.

**ASKR** (Anglo-Saxon, *ask*, an "ash tree"), the name in Norse mythology of the first man created by the gods.

**AS'MAI**, or **ASMAYI**, ABU SAÏD ABD-EL-MELEK IBN KORAÏB EL-ASMAÏ, b. about 740 A.D.; preceptor to Harun-al-Raschid, and an important representative of Arabic literature in the 8th century. Sir Henry Rawlinson calls A.'s history of the kings of Persia and Arabia previous to Islam, "perhaps the most valuable and authentic historic volume in the whole range of Arabian literature." His romance of *Antar* has been called "the Iliad of the desert." He d. about 830 A.D., leaving several pupils who became celebrated.

**ASMANNSHAUSEN**, a village in the jurisdiction of Rudesheim, Nassau, is famed for the wine which is produced on the slate-mountains in its vicinity. Of this there are two kinds, red and white, the former of which is greatly preferred. It has a rich red color, like Burgundy, possesses a rare aromatic flavor, and is noted for its uncommon strength and fire. But it retains its excellent qualities only about three or four years; after which, year by year, it becomes weaker, and loses its color. The choicest sort, which is preferred by connoisseurs to all the other red wines of the Rhine, and even to Burgundy itself, is cultivated in the ducal vineyards at Wiesbaden.

**ASMODE'US** (properly, ASCHMEDAI, "the destroyer"), an evil genius or demon mentioned in the later Jewish writings. A. was described as the author of many evils. In the book of Tobit (q.v.), he is represented as slaying the seven husbands of Sara, and hence, in modern times, has been jocularly spoken of as the destroying demon of matrimonial happiness. In the Talmud, A. is described as the prince of demons, and is said to have driven Solomon from his kingdom.

**ASMONE'ANS**. See **MACCABEES**.

**ASMONE'US**, or **ASSAMONEUS**. See **MACCABEES**, *ante*.

**ASO'CA**, *Jonesia asoca*, an Indian tree of the natural order *leguminosæ*, sub-order *cæsalpiniceæ*, remarkable for the beauty of its red and orange flowers. The leaves are abruptly pinnate, shining, and very beautiful. The A. is often mentioned in Indian poetry, and is connected also in various ways with the Hindoo mythology.

**ASO'KA**, **ASHOKA**, or **DHAR-MA-SOKA**, sovereign of India, son of Bindusara, b. about 300 B.C. He attempted to kill his father and was banished, but returned as his father was dying, killed all except one of his brothers, and seized the throne. Conversion to Buddhism quite changed his nature, and he built many monasteries, and left monuments that show his rule to have extended over the greater part of Hindostan.

**ASO'LA**, a fortified t. of northern Italy, in the province of Brescia, situated on the left bank of the Chiese, 19 m. w.n.w. from Mantua. It is a place of great antiquity.

The chief branch of industry, not agricultural, is the manufacture of silk twist. Pop of commune, 5500.

ASOPUS, the god of the river A., married to Methope, by whom he had two sons and from 12 to 20 daughters. These daughters were carried off from time to time by the gods; but when Zeus took away Aegina, A. rebelled and proposed to fight the abductor; whereupon Zeus immortalized the angry parent by transfixing him with lightning.

ASP, *Aspis*, a venomous serpent, the name of which has come down from ancient times; the vague descriptions of ancient authors, however, causing uncertainty as to the species. It is very generally supposed to be the *naja haje*, the el haje or haje nasher of the Arabs, which is very common in Egypt, Cyprus, etc., and often appears in hieroglyphic and other sculptures as one of the sacred animals of ancient Egypt. It is sometimes from 3 to 5 ft. in length, of nearly equal thickness throughout, with a gradually tapering tail; brownish, varied with dark and pale spots; the scales of the neck, back, and upper surface of the tail slightly carinated; the tail about one fourth of the whole length of the animal. The neck is capable of considerable dilatation, through the distension of its loose skin, although not so much as that of the nearly allied cobra da capello of India (*naja tripudians*). The dilatation of the neck takes place when the serpent is irritated. The jugglers of Egypt are accustomed to perform tricks with this serpent, as those of India with the cobra da capello, causing it to dance to their music; after they have first, however, carefully extracted the poison-fangs. It is very venomous. Several varieties exist at the cape of Good Hope, one of which is nearly white; and one is called spough slang, or spitting snake, by the colonists, from its supposed power of ejecting its poison to a distance when irritated; the poison which distills from the fangs in such circumstances being probably carried off by the forcible expirations which the creature makes—a characteristic, however, not exclusively belonging to a particular variety.—Other serpents of the same family, *viperidae*, are by some believed to be the true asp, particularly *vipera echis* and *V. cerastes*. The former is of a grayish or yellowish brown color, with rays and eye-like spots on the upper parts: it is found both in India and the n. of Africa. The latter is of a grayish color, and has a very broad heart-shaped head, a short obtuse rounded muzzle, and the superciliary or eyebrow scales remarkably developed, so that one of them is often produced into a sort of spine: it inhabits the deserts of northern Africa.—The name asp is now generally given to *vipera aspis*, a native of the Alps, found also in the s.e. of Europe and in Sicily, which much resembles the common viper, but is more slender, and has a larger head; it is also more venomous.

ASPARAGINE ( $C_4H_8N_2O_6, 2HO$ ) is a crystalline substance which exists ready formed in common asparagus, in the marsh-mallow, in comfrey, in potatoes, in chestnuts, in the leaves of the deadly nightshade, in licorice root, in the milky juice of the lettuce, in the tubers of the dahlia, and in the young shoots of vetches, peas, beans, etc. According to Piria, the young shoots of these plants, when formed in the light, contain as much asparagine as when they are grown in the dark, but the asparagine disappears as the plant arrives at the flowering stage. Other chemists, including Pasteur, find that vetches grown in light are free from asparagine. This substance is readily obtained from the expressed juice of the young shoots of asparagus, of young vetches, etc., which, after filtration and evaporation to a sirup, soon deposits it in crystalline prisms of a right rhombic form. These crystals dissolve freely in boiling water, the cooled solution having a mawkish and cooling taste, and a slight acid reaction. Asparagine exhibits two remarkable transformations. (1.) When its aqueous solution is heated with alkalis or acids it is decomposed into aspartic acid ( $C_4H_7NO_5$ ) and ammonia; from this and other reactions, there is no doubt that it should be regarded, according to modern views, as the amide (q.v.) of aspartic acid. (2.) While a solution of pure asparagine-crystals remains unchanged, if any coloring-matter is present the solution passes into fermentation, and the whole of the asparagine is converted, by the assimilation of hydrogen, from the pigment into succinate of ammonia, a reaction which may be expressed as follows:

Like most of the amides, this substance unites both with acids and alkalis, but the resulting compounds are of little general interest. That asparagine plays an important part in the physiology of plants, is obvious from its wide distribution.

ASPARAGUS, a genus of plants of the natural order *liliaceae*, having an almost bell-shaped six-partite perianth upon an articulated stalk, six stamens, one style, with three recurved stigmas, and the cells of the berry two-seeded. The species of this genus are herbaceous or shrubby plants, natives chiefly of the s. of Europe and of Africa, with abortively dioecious flowers; the stem is unarmed in some, in others thorny; at its first sprouting leafless, and covered with scales at the top; afterwards very much branched, with numerous fasciculate, generally bristle-like leaves. The most widely diffused species is the common A., *A. officinalis*, a native of Europe, which grows on the banks of rivers and on the sea-shore, in meadows and bushy places, especially in sandy soils, occurring in a few places in Britain, and is also in general cultivation as a garden vegetable; its young shoots, when they first sprout from the earth, forming a much esteemed

article of food, which, however, is only in a slight degree nutritious. These sprouts contain a peculiar crystalline substance called *asparagine*, and have a specific action on the urinary organs, so that their long continued use in very large quantities is apt even to produce bloody urine. They are no longer retained in the pharmacopœia, but both the shoots and the roots of *A.* are still occasionally used as a diuretic in dropsies, and as a lithic to dissolve urinary calculi. For these purposes the root is preferred, and is administered in the form of an infusion or decoction.—The thick and tender kinds of *A.* are most esteemed for the table. It is one of those plants which have been much increased in size and considerably altered in general appearance, by cultivation, being seldom more than a foot high in its wild state, and not much thicker than a goose-quill, whereas it has been obtained in gardens more than half an inch in diameter, and its stems rise to the height of 4 or 5 ft. It was a favorite vegetable of the ancient Romans. It is generally planted in rows, at distances varying from 1 to 2½ ft. Litter or vegetable mold is spread over it in autumn. It is allowed to occupy the same ground for many years, and the shoots are not gathered for use till the plants are four years old. Some of the growers of *A.* for the London market have 100 acres under this crop.—The seeds have been used as a substitute for coffee, and are recommended for that use upon the continent even at the present day. A kind of spirit has been made from the fermented berries. The young shoots of several other species are also eaten, as those of *A. tenuifolius*, *A. acutifolius*, and *A. albus*, natives of the s. of Europe; the last of which is much used in Spain and Portugal as a salad, in soups, and as a boiled vegetable. On the other hand, the sprouts of the bitter *A.*, *A. scaber*, which is very similar to the common *A.*, are uneatable, on account of their great bitterness.

#### ASPARAGUS STONE. See APATITE.

**ASPA'SIA**, one of the most remarkable women of antiquity, was the daughter of Axiochus, and born at Miletus. The circumstance that in Athens all foreign women, whatever their character, were equally esteemed, or rather disesteemed, and that their children, even when begotten in wedlock, were held illegitimate, has originated the erroneous notion that *A.* was a courtesan. She certainly broke through the restraint which confined Athenian matrons to the seclusion of their own homes; for after her union with Pericles, who had parted from his first wife by her own consent, her house became the rendezvous of all the learned and distinguished people in Athens. Socrates often visited her. Her eloquence and knowledge of politics were extraordinarily great. Her husband—though, strictly speaking, the Athenian law would have refused this appellation to Pericles—was honored with the title of Olympian Jove, while she herself was dignified with the name of Juno. From the comic writers and others she received much injustice. It was Hermippus, the comic poet, who took advantage of a temporary irritation of the Athenians against Pericles, to accuse *A.* of impiety; but the eloquence of the great statesman disarmed the enmity of the judges, and procured her acquittal. Her influence over Pericles must have been singularly great, although this has obviously been exaggerated, and even caricatured. The brilliant but not historically accurate Aristophanes charges her with the origin both of the Samian and Peloponnesian war, the latter on account of the robbery of a favorite maid who belonged to her. Plutarch vindicates her against such accusations; and Thucydides, who details minutely the causes of the Peloponnesian war, does not once mention her name in connection with these. After the death of Pericles, *A.* married Lysicles, a cattle-dealer (an important, lucrative, and dignified profession in ancient times), who, through her influence, soon became an eminent man in Athens. The name of *A.* was, after her death, applied to many women of remarkable accomplishments and amiability.

**ASPÊ**, a t. of Valencia, Spain, in the province of Alicante, and 21 m. w. from Alicante, near the river Elcha. It is pretty well built, but the streets are narrow and winding. It has numerous flour-mills and oil-mills, also soap-manufactories and brandy distilleries. There is a considerable trade in wine. Pop. 6744.

**ASPECTS**, in astronomy, are certain positions of planets with respect to one another, as seen from the earth. In the days of astrology, there were five aspects—conjunction (indicated by the symbol  $\odot$ ), sextile ( $\ast$ ), quartile ( $\square$ ), trine ( $\triangle$ ), opposition ( $\oslash$ ). Two planets are in conjunction when they have the same longitude; the aspect is sextile when they are 60° apart; quartile, when the distance is 90°; trine, when it is 120°; and at 180° they are opposite to one another, or in opposition. Astrology ascribed to these *A.* great influence over the fate of individuals and of nations. The only two of the terms now in use are *conjunction* and *opposition*.

**ASPEN**, or TREMULOUS POPLAR (*populus tremula*, see POPLAR), a tree which grows plentifully in Europe and in Siberia. It is a native of Britain, and is frequent in Scotland, where it is found even at an elevation of 1500 ft. above the sea. It has received the specific name *tremula*, from the readiness with which its leaves are thrown into a tremulous motion by the slightest breath of wind—a property for which, indeed, the aspen-leaf has become proverbial. The leaves are nearly orbicular, but broadly toothed, so as almost to exhibit angles. The footstalks are compressed, which favors the readiness of motion. It grows quickly, with a straight stem, reaching to a height of from 40 to 80 or even 100 ft. In unfavorable situations, it becomes dwarfish. The wood is soft, porous,

light, white, and smooth; it does not make good fuel, but is very fit for the turning-lathe, and especially for being made into troughs, trays, pails, etc. It is deemed excellent for arrows. If the stem be peeled and allowed to dry before it be cut down, the wood becomes harder, and it is then capable of being used as timber for the interior of houses, and on this account the tree is of great importance in many districts, and the more so as it succeeds in any soil, although it prefers one which is moist and gravelly. The bark contains a great quantity of a bitter alkaloid, *salicin*. The charcoal made from this tree can be used in the manufacture of gunpowder.—*Populus trepida*, a very similar species, a native of North America, is called the American A. It is regarded by some as a mere variety. Very similar, also, is another North American species, *P. grandidentata*.

**ASPENDUS**, a city of Asia Minor, on an isolated hill near the river Eurymedon, at the extremity of the plain of Perga. It was founded by a colony from Argos, 500 years before Christ, and reached high prosperity, as the ruins attest. These are: a theater so nearly complete that a little repairing would make it available for its original purpose; a noble aqueduct; a forum, and other buildings. Cicero says that it was rich in statues, but that Lucius Verus carried them away. Twice A. is mentioned in history—when its citizens assassinated Thrasylbulus, and when the city surrendered to Alexander.

**ASPERGILLUM**, a remarkable genus of lamellibranchiate conchiferous mollusca, in which the shell has the form of an elongated cone, terminating at the larger end in a disk, which is pierced with numerous small tubular holes, the little tubes of the outer range being largest, and forming a sort of ray around it. The animals of this genus are borers, some of them living in sand, others burrowing in stone, wood, or thick shells. *A. javanum* is popularly called the watering-pot, and the same resemblance has suggested the name A. (from the Latin *aspergo*, to sprinkle). The most interesting circumstance in the structure of the shelly tube of A. is the presence of two small valves, incorporated in the substance of the tube, to which they bear a very small proportion. "They there form the stamp," says Owen, "of its true affinities, but subserve as little any ordinary final purpose as the teeth buried in the gums of the fetal whale." The affinities are with mollusca inhabiting bivalve shells. A rudimentary bivalve shell is found, in like manner, cemented into the shelly tube of the fossil *teredina*, which bored the drift-wood of the London clay.

There is also a genus **ASPERGILLUS** in botany, containing many of the small fungi commonly known by the name of mold (q.v.), which occur on decaying substances of various kinds. Some of the species are peculiar to diseased animal tissues.

**AS'PERN**, or **GROSS AS'PERN**, a village of Austria, on the left bank of the Danube, 5 m. e.n.e. of Vienna. Pop. about 700. This village and the neighboring one of Essling are celebrated as the scene of a sanguinary battle in the summer of 1809, between the French army under Napoleon I. and the Austrians under archduke Charles. After the battle of Eckmühl, in which the Austrians were defeated, the archduke retired to the left bank of the Danube, leaving the road to Vienna open to the French. On the 12th of May, 1809, the French army entered Vienna, when the archduke concentrated his forces on the opposite bank of the river. Napoleon threw bridges over the river, and on the 21st the French army began crossing to the attack. The Austrians at first seemed to give way; but when about half the French had crossed the river, they returned to the charge, and almost surrounded the enemy in the narrow plain between the two villages. Here ensued the battle of A., a terrific conflict, the grand object of the contending hosts being the possession of the villages. At the close of the day, it remained undecided; but next morning it was renewed with fury on either side, when, after terrible slaughter, Napoleon ordered a retreat, and his shattered ranks retired to the little island of Lobau, in the middle of the river, whence they afterwards slowly withdrew to the right bank. The loss on the side of the Austrians was given at 4000 killed and 16,000 wounded; that of the French at double that amount. Marshal Lannes, the most daring among the French generals, was among the slain. Both the villages were reduced to heaps of ruins.

**ASPERULA**. See **WOODRUFF**.

**ASPHALT**, or **ASPHALTUM**, is the name given to a bituminous substance of a solid consistence. See **BITUMEN**. It probably owes its origin to vegetable matter which has been subjected to a slow process of decomposition or decay, resulting in the production of a bituminous coal, from which, by volcanic agency, the A. has been distilled and diffused over the neighboring district. The largest natural deposit of A. is in the island of Trinidad, where the plain known as the *Pitch lake* is found. See **TRINIDAD**. The A. from Trinidad is largely used for ships' bottoms, and is reputed to kill the teredo or borer, which proves itself so very destructive to the wood of ships in tropical regions. A. is also found on the shores of the Dead sea in large quantity, and is known to the Arabs by the name of *hajar mousa*, or *Moses's stone*. It likewise occurs in South America at Coxitambo near Cuenca, in Alsace, and other parts of the European continent, in east Lothian and Fifeshire (Scotland), in Shropshire, etc.

During the manufacture of coal-gas, much tarry matter is evolved from the retort, and is received in the coolers or condensers. If this tar be subjected to partial distillation, naphtha and other volatile matters escape, and an artificial A. is left behind, which possesses the principal properties and can be employed for the majority of purposes to

which native A. is applied. The various kinds of A. have a pitchy odor, are of a black or dark-brown color, but do not soil the fingers; are insoluble in water, sparingly soluble in alcohol; but are in great part dissolved by ether, oil of turpentine, and naphtha. *Petroleum* (q.v.), or *rock oil*, is a native liquid bitumen, which largely exudes from crevices in rocks in many districts, and is essentially A. dissolved in naphtha. The specific gravity of A. is very near that of water, ranging from 1000 to 1100. When set fire to, it burns readily with a smoky flame, and is often used in the smaller gas-works as fuel, by being allowed to run very slowly into the furnace-fires. A., besides being employed for coating the exterior of ships' bottoms, is also used, in a heated condition, for saturating timber which is intended for piles in the construction of breakwaters, river-bridges, and other situations where the combined action of the air, water, and minute animals would soon render ordinary wood rotten and useless. Wooden houses may be preserved in the same manner by a coating of A. applied externally; and ground-flooring placed in damp situations is much the better for the spaces between the planks being filled up with A.

About 1840, A. began to be generally used for foot-pavements in cities, and also for floors of cellars and out-houses. For purposes of this nature it is heated in portable boilers, into which, at a certain stage of the preparation, there is poured a quantity of thoroughly dried sand, gravel, or powdered limestone, which is well mixed with the liquid A. The mixture is then spread on the spot prepared for it; and when cool, forms a hard kind of pavement. Of this method of forming footways, high expectations were at first formed; but latterly the process of asphaltting has gone out of use in England, as it is found not to be so durable as stone, and therefore, in ordinary circumstances, more costly. In Paris, however, asphaltting is still extensively practised in the more spacious thoroughfares. The better kinds of A. are used in the manufacture of the black varnish, which is employed in forming the enamel which coats the variety of leather known as *patent leather*. A. is not of itself used in medicine, but its natural solution in naphtha, viz., *petroleum*, is a valuable agent when applied either externally or internally. The synonyms of A. are—*native pitch*, *mineral pitch*, *Jews' pitch*, *Dead Sea bitumen*, *compact bitumen*, *Trinidad bitumen*, and *maltha*.

**ASPHALTIC COAL**, a coal-like substance in the cavities of the older rocks, having evidently fallen into the fissures while in a liquid or very plastic state. It is considered to be a species of very old asphalt that has lost most of its oil and become compact from age. It is found in carboniferous rocks, in New Brunswick and West Virginia; and in Ohio and Kentucky, in the devonian.

**ASPHODEL**, *Asphodelus*, a genus of plants which has by many botanists been made the type of a natural order *asphodeleæ*, now, however, generally regarded as forming part of the order *liliaceæ*. The *asphodeleæ* are either fibrous-rooted or bulbous-rooted. Among the latter are onions, hyacinths, squills, star of Bethlehem, etc.; among the former, asparagus, A., etc. The roots of the asphodels are fleshy and thick. The species are not very numerous, and are mostly natives of the countries around the Mediterranean sea. The yellow A. (*A. luteus*) and the white A. (*A. albus*) have long been known in Britain as garden-flowers. The yellow A. has an unbranched stem 2 to 3 ft. high, much covered by the sheathing bases of the long narrow leaves. The leaves of the white A. are all radical, and its flowers are in branched clusters. Both species flower about the time when spring passes into summer.

**ASPHYXIA** (Gr.) means literally a cessation of the pulsation from any cause, but is usually applied to the condition resulting from the blood in the body no longer being brought into the proper relations to the atmospheric air by respiration, so as to allow a sufficiently free exchange of carbonic acid for oxygen. See **RESPIRATION**. A., or suspended respiration, may result from several causes. No air, or but a scanty supply, may be admitted, as in strangulation, drowning, choking, or disease in the windpipe; the chest may be prevented from expanding either from a superincumbent weight or paralysis, as when a man breaks the upper part of his neck above the phrenic nerve, thus paralyzing the diaphragm; and again, although there may be every capacity for respiration, the air itself may be in fault, and contain too little oxygen in proportion to other elements, as carbonic acid or sulphuretted hydrogen, which act as poisons when inhaled. Aquatic animals may be asphyxiated either by depriving the water they inhabit of oxygen, or impregnating it with the gases just mentioned.

As this condition of A. advances, in drowning or otherwise, the small vessels of the lungs become gorged with blood, which the heart has no longer power to force freely through them, the right side of the heart and pulmonary artery become filled with blood, while but little returns to the arterial or left side of the heart.

The person becomes pallid, except in such vascular parts as the lips, cheeks, and finger-tips, which become blue; and soon the blood, no longer aerated, produces the phenomena of poisoning by carbonic acid. After some slight convulsive movements, the person becomes insensible, the pulsations of the heart grow gradually feebler, and at last cease altogether. In man this occurs in from a minute and a half to five minutes. Some persons, no doubt, as the Ceylon divers, can by habit do without a fresh supply of air for a longer period; and some diving animals have an arrangement of blood-vessels by which they are enabled to be under water for a long time. Restoration of asphyxiated persons may be attempted with hopes of success at a very long period after

apparent death. The object of all methods is of course to fill the lungs with fresh air. One of the most efficient is that of the late Marshall Hall: lay the person down at once with his head on his left arm, open the mouth, and draw the tongue forwards, then roll him gently over towards the left till he is nearly quite over on his face, then on to his back again, making the body by its own weight compress the chest, which, on expansion by its elasticity, fills with air. Repeat this about 15 times in a minute. This remedy nearly superseded all others for the restoration of still-born infants and other asphyxiated persons, before the introduction of the method of Dr. Sylvester, an account of which is given under **RESPIRATION, ARTIFICIAL**.

**ASPHYXIANTS.** Chemical substances inclosed in shells or other projectiles, and which act by producing a suffocating and poisonous effect. The French secretly made experiments with asphyxiating shot at Brest in 1851. The principle of these missiles seems to have been to carry into an enemy's ship the means of generating deadly gases which would suffocate the crews between decks. Scientific artillerists dread and discountenance these novelties; they have learned to regard war almost as a mathematical science, or, at any rate, as an elaborate application of such science; and they see nothing but savage cruelty in the "diabolical chemistry" of asphyxiants. General Sir Howard Douglas, in a late edition of his *Naval Gunnery*, says: "The author learns, with great regret, that some awful experiments have been made with fearful success, in the royal arsenal, with asphyxiant projectiles, combining in a frightful degree incendiary with suffocating effects." Adverting to sick and wounded men on board a ship-of-war, he exclaimed: "What shall be said of that inhuman system preparing for naval warfare in this age of enlightened humanity, which would advisedly, purposely, and deliberately consign the whole of these, and all other survivors, to indiscriminate death or mutilation? A ship may be sunk in action; yet there is always time to remove the sick and wounded, and save the survivors; but who shall approach a ship on fire to rescue her crew from the sudden and awful effects of that merciless and barbarous system, the object of which is to set fire to her at heart, and, if possible, blow her up?" The earl of Dundonald, captain Norton, Mr. Macintosh, and many other inventors, some years ago brought asphyxiating compositions before the notice of the English admiralty and war-office; and the French arsenals were known to possess many such in store. Some of these compositions are liquids which burn fiercely, and ignite wood and canvas readily; some are contained in shells which, on bursting, scatter the suffocating and burning substances all around; and some assume other forms.

**ASPIDIUM.** See **FERN, MALE**.

**ASPINWALL**, a t. in Colombia, virtually, however, a colony of the United States. It is situated at the Atlantic extremity of the Panama railway, in lat. 9° 23' n., and long. 79° 55' w., being about 8 m. to the n. of the old Spanish port of Chagres, 49 m. from Panama, and equidistant from the great trading capitals of Valparaiso and San Francisco. From its commanding position as a place of transit, A. is one of the busiest and most prosperous towns in the new world. It monopolizes the benefits of the traffic in both directions, to the almost utter exclusion of the rapidly decaying Panama. The climate of A., formerly very unhealthy, has been greatly improved by drainage. A. derives its name from Mr. Aspinwall, the originator of the Panama railway; it is also called *Colon*.

**ASPINWALL, WILLIAM**, 1743-1823, a surgeon in the revolutionary army. He was celebrated for the practice of inoculation, and his ready adoption of vaccination.

**ASPIRATE**, the name given to the letter *h* in grammar, as marking, not an articulate sound, but a *breathing* (Lat. *spiro*, I breathe). It is also applied to a class of consonants. There is felt at once to be a relation, accompanied by a difference, between *p* and *f*, *t* and *th*, etc. To express the difference, the Greeks called the first of such a pair *psilon* (bare), the second *dasu* (rough); the Latin grammarians adopted the terms *lene* and *aspirate*, probably from the erroneous notion that the difference consists in the addition of the sound of *h*. There being no sound and no character in Latin corresponding to the Greek *theta* (*theta*), the Romans represented it by *th*; and this misleading expedient is continued for representing this aspirate and several others in all the alphabets derived from the Roman. According to some the word ought to be *asperate*, i.e., "roughened." Of the sixteen mutes in a complete system (see **LETTERS**), eight are *lene*, each having its corresponding aspirate.

*Lene*— *p*, *b*, *t*, *d*, *k*, *g*, *s*, *z*.  
*Aspirate*—*f*, *v*, *th*(in), *th*(ine), *ch*, *gh*, *sh*, *zh*.

In the corresponding words of allied languages, nothing is more common than the interchange of an aspirate and a *lene*: Ex., Lat. *pater*, Eng. *father*; Gr. *thura*, Ger. *thür*, Eng. *door*; Lat. *cap*(ut), Fr. *chef*, Eng. *chief*; Ger. *weib*, Eng. *wife*. Aspirated letters are also frequently interchangeable with one another: thus, Gr. *ther*, a wild beast, is in Lat. *fera*; Lat. *facere*, to do, becomes in Span. *hacer*.

**ASPIRATOR** is the name of an apparatus employed to draw air or other gases through bottles or other vessels. It is of great use in the examination of gases by the analytical

chemist. The simplest form of the apparatus is that represented in the figure, where A is a large vessel capable of being filled with water, having a tube with stop-cock at B, a second tube with stop-cock at C, and a thermometer introduced at D. In working,

Aspirator.

ing, the apparatus is filled with water; the tube C is attached to the vessels through which the gas is to be drawn; and the stop-cocks at C and B being opened, the weight of the water escaping at B acts as suction, and draws in the gas from the tube C and the attached bottles or other vessels. The thermometer at D denotes the temperature of the water, and subsequently gas, contained in the reservoir, while the upright turn of the tube B keeps any air from entering the reservoir by that route. —A more complicated form of A., but one which is much more convenient to experiment with, is that known as Brunner's A.; the principle of action, however, is the same.

ASPIS, or CLUPEA, an ancient fortified t. of Carthage, about 50 m. e. of that city, on the sea, and having an accessible harbor. Manlius and Regulus landed here in the first Punic war; in the third war the town sustained a siege, and it is noticed in the records of the Julian civil war. It was an important episcopal see from 411 to 646 A.D., and the last place where the African Christians made resistance to Moslemism.

ASPLENIUM, a genus of ferns, of the order or sub-order *polypodiaceæ*. The species are numerous, and widely diffused both in the northern and southern hemispheres. Many of them are of great beauty; and the small size of some recommends them to cultivators of ferns who find themselves much limited as to space. Some of the species bear the English name *spleenwort*, as *A. trichomanes*, *A. viride*, *A. adiantum-nigrum*, etc.,

having been formerly supposed efficacious in removing obstructions of the viscera. From the same circumstance the name A. (Gr. *a*, privative, and *splen*, the spleen) is derived. They have now fallen completely into disuse, but were at one time very much employed, chiefly in the form of a syrup like *capillaire* (q.v.), and were administered not only in cases of cough, asthma, diseases of the liver, and cutaneous diseases, but even in stone and gravel. But perhaps none of them was so extensively used as the species which is styled in old books common spleenwort (*A. ceterach*), now the type of a distinct genus, and known as *ceterach officinarum*. Some of them, as *A. trichomanes* and *A. adiantum-nigrum*, are frequently called maidenhair. *A. trichomanes* is a very beautiful little fern, common on rocks and old walls in Britain, and most parts of Europe, found also in some parts of Africa, and in North America. A very common British species, *A. ruta-muraria*, is popularly known as wall-rue.

ASPRONONTE, a mountain near Reggio, in s.w. Italy, near which, Aug. 28, 1862, occurred the fight between Garibaldi's volunteers and the Italian troops under Pallavicini. Garibaldi was defeated, and he and a large number of his men were taken prisoners.

ASPROPOTAMO. See ACHELOUS, *ante*.

ASS, *Equus asinus*, a well-known quadruped, usually referred by naturalists to the same genus with the horse (q.v.), but which it has recently been attempted to make the type of a distinct genus (*asinus*), including all the solid-hoofed quadrupeds (*solidungula* or *equidae*, see HORSE) except the horse itself. The distinction is founded on the short hair of the upper part of the tail and the tuft at the end of it, the darker stripes with which the color is marked, and the absence of the hard horny warts which are found on the hinder-legs of the horse, although the forelegs exhibit warts in a similar position. The long ears of the A. are one of the characteristics of the species, but they are longer in domestication than in a wild state. It is usually also distinguished by a black cross over the shoulders, formed by a longitudinal and a transverse streak, the general color being gray; but when the general color is darker or lighter than usual, the cross is often less apparent, or to be observed with difficulty. The facial line is arched.

Some uncertainty still exists as to the origin of the domestic A.; a number of wild races having been described, some of which are perhaps, like the wild horses of America, the progeny of animals that have escaped from domestication. The probability, however, appears to be that the A. is a native of central Asia, where it is found in a perfectly wild state, in Tartary, Mesopotamia, Persia, etc., on the banks of the Indus, and even to the southern extremity of Hindustan; but its range does not extend so far northward as that of the wild horse—a circumstance which may perhaps partly account for the inferiority of the domestic A. in northern climates. The wild A. is found both in mountainous districts and in plains; vast troops roam over the great Asiatic deserts, migrating, according to the season, in summer, as far northward as the Ural; in winter, southward to the borders of India. It is fond of bitter and saline herbage, and of brackish water. It was first accurately described by Pallas, under the name *koutan*, which it bears on the high steppes around the Caspian sea. It was, however, well known to the ancients, and is

called *onager* and *asinus sylvestris* by Pliny, who also mentions, under the name *hemionus*, another species (*equus hemionus*), a native of the same regions, now called the *kiang*, or the *dziggethai*. The latter name appears to be of Turkish origin, and to signify mountain A., but seems to be sometimes applied to the one of these species and sometimes to the other. This seems also to be the case with some of their other eastern names, as *khur* or *goor*, and is a source of no little confusion.—The cross on the shoulders is less observable in the koulán than it usually is in the domesticated A. It ought also to be mentioned that, in one remarkable particular, the domesticated A. agrees with the *equus hemionus*, and differs from the koulán, the infra-orbital foramen of the skull being situated much lower. But the *kiang* neighs like a horse, and the other *brays*. The harshness of the voice of the A. is ascribed to two small peculiar cavities situated at the bottom of the larynx.

The allusions to the wild A. in the Old Testament, and particularly in Job xxxix., naturally excite the surprise of readers acquainted only with the dull domestic drudge, the emblem of patience and stolidity; but to this day they are beautifully appropriate to the wild A. of "the wilderness," which has the "barren land" or "salt places" for its dwelling, and "the range of the mountains" for its pasture.—The wild A. has a short mane of dark woolly hair, and a stripe of dark bushy hair runs along the ridge of the back from the mane to the tail. It has longer legs, and carries its head higher than the domestic A. Its troops have always a leader. It is a high-spirited animal, very fleet and very wary, trying to the utmost the powers of the hunter. It is a principal object of the chase in Persia, where its flesh is prized as venison is in Europe, and it is accounted the noblest of game. Xenophon, in his *Anabasis*, describes the wild A. as swifter of foot than the horse, and its flesh as like that of the red deer, but more tender.

The domestic A. is also, in Arabia, Persia, Syria, and other eastern countries, a much finer animal than as it is usually seen in Europe, although in Spain the favorable influence of a more genial climate upon its development is visible, perhaps also of better treatment, the A. being more highly valued. The A. is much used for riding in, the East. From Judges v. 10, we learn that, at a very early period, the great were accustomed to ride upon white asses, and a preference is given to white asses in the east to this day. The A. has been domesticated from the earliest times; but it does not seem to have been introduced into Europe till a comparatively recent date. In Britain, it is employed chiefly by the poor, but might probably with advantage be much more generally employed than it is. Its price is scarcely one-twentieth of the price of the horse, and it can be kept at one-fourth of the expense, delighting in the coarse herbage which other animals reject, and satisfied with comparatively scanty fare. The obstinacy ascribed to the A. seems to be very generally the result of ill treatment; and proverbial as it has become for stupidity, it is probably quite equal in intelligence to the horse.

There are two hybrids between the A. and the horse—the Mule (q.v.), bred between the male A. and the mare; and the Hinny (q.v.), the offspring of the horse and the female A.

The milk of the A. contains more sugar of milk and less caseine than that of the cow, and is therefore recommended as a nutritious diet in cases of weak digestion. Its usefulness in cases of consumption has been long known, and it was often prescribed as a kind of specific when that disease was treated on principles very different from those which regulate its treatment now, and when very nutritious food was not usually prescribed to consumptive patients.

The leather called shagreen (q.v.) is made by a peculiar process from the skin of the A., which also affords excellent leather for shoes, and the best material for drums. The bones of the A., which are very solid, were used by the ancients for making flutes.

ASSAB', or SABA, a bay of the Red sea, 40 m. from the Indian ocean. It is about 16 m. long by 5 m. wide; it is bordered on the w. by high land; in its front are two coral islands, one of which, with cape Luna, forms a harbor for small craft. In 1869 an Italian steamship company bought the whole bay for a coaling station between the Suez canal and India.

ASSAI, a beverage very much used at Pará and other places on the Amazon, and which is prepared from the fruit of certain species of palm nearly allied to the cabbage palm of the West Indies. See ABECA and CABBAGE PALM. The A. palms are remarkably slender trees; the most common species (*euterpe oleracea* of Martius) rising to the height of 60 or 80 ft., with a smooth stem only about 4 in. in diameter. The fruit is small, in size and color resembling sloes, but is produced in great quantity upon branched *spadices*, which are thrown out horizontally beneath the crown of leaves. It consists of a hard seed, with a very thin covering of a firm pulp or flesh. The tree grows in swamps flooded by the high tides. Boys climb the trees for the fruit, upon which warm water is poured, and by rubbing and kneading, a liquid is procured, consisting simply of the pulp of the fruit and water, which is constantly vended in the streets of Pará, and of which the inhabitants are extremely fond. This is A. It is a thick, creamy liquid, of a purplish color, and a flavor like that of a freshly gathered nut. It is commonly used along with the bread made from manioc (q.v.), called *farinha*, and either with or without sugar. Half the population of Pará make a daily meal of A. and *farinha*; and upon this hundreds are said chiefly to subsist.—The stem of the A. palm is sometimes used for poles and rafters, and its terminal bud as a cabbage or as a salad with oil and

vinegar; but it is too much varieced upon account of its fruit to be often cut down for these purposes. — Another species, *euterpe Catinga*, is found in forests of a dry sandy soil and very peculiar vegetation, known as catinga forests. The beverage made from it is sweeter than the common kind, but the produce of the tree is much smaller.

**ASSAL**, an important salt-lake in the e. of Africa, 25 m. s.w. of Tajurrah, the chief seaport of Adel, lat.  $11^{\circ} 40' \text{ n.}$ , long.  $42^{\circ} 40' \text{ e.}$  Its length is 8 m.; its breadth, 4. It lies in a land remarkable for its wild, waste, and sterile character. A. is inclosed on all sides but the e. by hills, and is nearly 700 ft. below the level of the sea. Abyssinian caravans resort to it for the purpose of carrying off the salt which incrusts its shores, like ice, sometimes to the depth of half a foot. It has been supposed that it was at one time connected with the bay of Tajurrah.

**ASSAM**, a province at the n.e. extremity of British India, stretching in n. lat. from  $22^{\circ}$  to  $28^{\circ}$ , and in e. long. from  $90^{\circ}$  to  $98^{\circ}$ , and containing, in '72, 4,132,019 inhabitants on an area of 58,856 sq. miles. In 1874 it was formed into a separate administration (including Cachar) under a chief-commissioner. It forms a part of the basin of the lower Brahmaputra, and is intersected also by about 60 other rivers. Being thus irrigated, as it were, by nature, A. abounds in wood, and is very fertile. Among its indigenous productions is the tea-plant. In the year 1874, the yield of tea was 11,082,958 lbs. The other products are rice, mustard, gold, ivory, amber, musk, silver, iron, lead, petroleum, and coal. From Bengal the principal imports are woollens, India fabrics, salt, opium, glass, earthenware, tobacco, betel, etc.

In 1826, at the close of the first Burmese war, A. was ceded to the British. The upper portion of the province, however, was conferred, as a separate principality, on the native rajah, whom the Burmese had expelled; and it was only in 1838, that in consequence of his misgovernment, the entire country was actually placed under British administration. Since then, the province has exhibited a noticeable improvement, for which, considering that the population is only about 60 to the square mile, there is still, however, almost unlimited scope. The great evil is the prevalence of earthquakes, few months passing without a shock or two. The people, however, seem to think lightly of them—the only one that is specially remembered as being of extraordinary severity having occurred as far back as 1807.

A. is divided into 13 districts. Gowhati and Silhat are the only towns of considerable size.

One of the most striking features of A. is the abundance of wild animals, such as tigers, rhinoceroses, leopards, buffaloes, and elephants. Of the elephants, not less than 500 are annually caught; and when tamed, bands of them may be seen, harmless as cows, in the charge of a single attendant. The forests teem with game, and the rivers with fish.

**ASSAROTTI**, OTTAVIO GIOVANNI BATTISTA, 1753-1829, founder of schools for deaf mutes in Italy. He studied for the priesthood and became lecturer on theology to the society of the Pietists. Hearing of the Abbé Sicard's experiments with mutes, he began with a single pupil in 1801, and had slowly gathered a small number, when, in 1805, Napoleon heard of his work and provided a schoolhouse and revenue to support 12 pupils. He kept the school with success until his death. Nothing is known of his methods of instruction.

**ASSASSINS**, a military order, a branch of the secret sect of the Ismaelites (q.v.). The secret doctrines of these Ismaelites, who had their head-quarters in Cairo, declared the descendants of *Ismael*, the last of the seven so-called imaams, to be alone entitled to the califate; and gave an allegorical interpretation to the precepts of Islam, which led, as their adversaries asserted, to considering all positive religions equally right, and all actions morally indifferent. The atrocious career of the A. was but a natural sequence of such teaching. The founder of these last, Hassan-ben-Sabbah-el-Homairi, of Persian descent, and imbued with the free-thinking tendencies of his country, had, about the middle of the 11th c., studied at Nishpur, under the celebrated Mowarek, and had subsequently obtained from Ismaelite *dais*, or religious leaders, a partial insight into their secret doctrines, and a partial consecration to the rank of dai. But on betaking himself to the central lodge at Cairo, he quarreled with the heads of the sect, and was doomed to banishment. He succeeded, however, in making his escape from the ship, and reaching the Syrian coast, after which he returned to Persia, everywhere collecting adherents, with the view of founding, upon the Ismaelite model, a secret order of his own, a species of organized society which should be a terror to his most powerful neighbors. In 1090, Hassan conquered the fortress of Alamut, in the Persian district of Rudbar; and continued to increase in strength, intimidating princes and governors by a series of secret murders, and gaining possession of several fortified castles, with their surrounding territories, both in the mountain range south of the Caspian, in Kuhistan, and in the mountains of Syria (Massiat). The internal constitution of the order, which had some resemblance to the orders of Christian knighthood, was as follows: First, as supreme and absolute ruler, came the Sheikh-al-jebai, the prince or old man of the mountain. His vicegerents in Jebal, Kuhistan, and Syria were the three *Dai-al-kebir*, or grand priors of the order. Next came the Dais and Refiks, which last were not, however, initiated, like the former, into every stage of the secret

doctrines, and had no authority as teachers. To the uninitiated belonged first of all the Fedavies or Fedais—i.e., the devoted: a band of resolute youths, the ever ready and blindly obedient executioners of the old man of the mountain. Before he assigned to them their bloody tasks, he used to have them thrown into a state of ecstasy, by the intoxicating influence of the *hashish* (the hemp-plant), which circumstance led to the order being called Hashishim, or hemp-eaters. The word was changed by Europeans into Assassins, and transplanted into the languages of the west with the signification of murderers. The Lasiks, or novices, formed the sixth division of the order, and the laborers and mechanics the seventh. Upon these, the most rigid observance of the Koran was enjoined; while the initiated, on the contrary, looked upon all positive religion as null. The catechism of the order, placed by Hassan in the hands of his dais, consisted of seven parts, of which the second treated, among other things, of the art of worming themselves into the confidence of men. It is easy to conceive the terror which so unscrupulous a sect must have inspired. Several princes secretly paid tribute to the old man of the mountain. Hassan, who died at the age of 70 (1124 A.D.), appointed as his successor, Kia-Busurg-Omid, one of his grand-priors. Kia-Busurg-Omid was succeeded in 1138 by his son Mohammed, who knew how to maintain his power against Nureddin and Jussuf-Salaheddin. In 1163, Hassan II. was rash enough to extend the secret privilege of the initiated—exemption, namely, from the positive precepts of religion—to the people generally, and to abolish Islam in the Assassin state, which led to his falling a victim to his brother-in-law's dagger. Under the rule of his son, Mohammed II., who acted in his father's spirit, the Syrian Dai-al-kebir, Sinan, became independent, and entered into negotiations with the Christian king of Jerusalem for coming over, on certain conditions, to the Christian faith; but the templars killed his envoys, and rejected his overtures, that they might not lose the yearly tribute which they drew from him. Mohammed was poisoned by his son, Hassan III. who reinstated Islamism, and thence obtained the surname of the New Moslem. Hassan was succeeded by Mohammed III. a boy of nine years old, who, by his effeminate rule, led to the overthrow of the order, and was eventually murdered by the command of his son, Rokn-eddin, the seventh and last old man of the mountain. In 1256, the Mongolian prince, Hulagu, burst with his hordes upon the hill-forts of Persia held by the Assassins, which amounted to about a hundred, capturing and destroying them. The Syrian branch was also put down about the end of the 13th c., but remnants of the sect still lingered for some time longer in Kuhistan. In 1352, the A. reappeared in Syria, and indeed they are still reported to exist as a heretical sect both there and in Persia. The Persian Ismaelites have an imaum, or superintendent, in the district of Kum, and still inhabit the neighborhood of Alamoot under the name of Hosseinis. The Syrian Ismaelites live in the district of Massiat or Massvad. Their castle was taken from them in 1809 by the Nossaries, but afterwards restored. See Hammer, *Geschichte der Assassinen* (Stutt. and Tüb. 1818); Guyard, *Fragments* (1874).

**ASSAULT.** In the sudden and vigorous attack on a fortified post, which is called an A., the troops are told-off into "storming-parties," "supports," and "firing-parties." The storming-parties are those who take the most terrible duty, being that of making a forcible entry into the place. The firing-parties or musketeers seek to shield the storming-parties as much as possible from the fire of the enemy; they spread themselves out in extended order to keep down the fire of the garrison—aiming at any soldier who may show his head above the parapet, and seeking to disable the artillerymen by firing into the embrasures. Many assaults are made by *surprise*; and in that case the storming and firing parties order all their preliminary movements as quietly as possible. In most cases, there is a necessity for the stormers to descend into a dry ditch, and to ascend from the ditch to a breach or a gate in the fortified wall. To aid in this duty, "ladder-parties" are placed at the disposal of the storming-parties; these men have previously been practiced in carrying scaling-ladders, descending and ascending ditches, and adjusting the ladders. In some celebrated sieges, ladders 40 ft. long have been used, where the ditch was deep and the wall or bastion high; but it is seldom that a storming-party could venture on so perilous a work, for the men crowded on such a ladder would endanger each other. The "supports" are troops who keep a little in the rear of the storming and firing parties.

**ASSAULT, in Law.** See BEATING AND WOUNDING.

**ASSAY**, or **ASSAYING**, is the process employed in determining the proportion of pure metal in a metallic ore or in an alloy. This method of analysis is more generally followed in the examination of compounds of silver and gold, but is likewise resorted to in the investigation of ores of iron, copper, tin, zinc, bismuth, antimony, mercury, and lead. In manufactured articles, also, such as silver-plate and gold-plate, some foreign metal (generally copper) is present, to impart hardness to the metal; and in Great Britain, each article is assayed at the Goldsmiths' hall, previously to being sold, so as to determine the exact richness of the metal whereof it is made. In the A. of compounds containing silver, the apparatus employed is a *cupel*—a small basin-shaped vessel made of bone-ash: and a *nuffle*, composed of fire-clay, about 8 in. in length and 3 to 4 in. in diameter, shaped like a miniature railway tunnel, open at one end, closed at the other end, and having numerous slits or air-holes along the side. The more simple A. of silver con-

sists in the examination of argentiferous lead ore. By a preliminary process, the sulphur is separated (see LEAD); and weighed fragments of the mixed lead and silver being placed on cupels, the latter are introduced into the muffle, which has been previously heated in a furnace, where it still remains. The fire is then increased, and air being admitted to the muffle, the oxygen of the air unites with the lead, forming oxide of lead ( $PbO$ ), which in part volatilizes through the openings in the side of the muffle, and in other part sinks into the porous bone-earth of which the cupel is made. Whilst the lead is thus carried away, the silver remains behind as a molten metallic globule, and when the last traces of lead-fumes leave the silver bead, the latter suddenly *lightens*, and immediately thereafter becomes brilliant and white. On being slowly allowed to cool, the globule of silver may be weighed, and the amount of pure metal thus determined. The use of the cupel during this process has led to the term *cupellation*, being employed in place of A. When silver contains copper, which it does in ordinary coinage and silver-plate, it becomes necessary to mix lead with the alloy before attempting to separate the copper. The manner in which the lead is generally added is to roll the alloy of silver and copper in a piece of sheet-lead or lead-foil, and place the whole package on the cupel. During the heating in the muffle, the lead oxidizes as usual, and in part passing into the bone-earth of the cupel, carries the copper with it. The amount of lead required to effect the separation of copper from silver in this way is given in the following table:

Standard of silver in one part.	Amount of copper Alloy in one part.	Quantity of lead necessary for one part of alloy.	Quantity of lead in relation to that of copper.
1000	0	$\frac{1}{10}$ part.	
950	50	3 parts.	60 to 1
900	100	7	70 " 1
800	200	10	50 " 1
700	300	12	40 " 1
600	400	14	35 " 1
500	500	16 to 17	32 " 1
400	600	16 " 17	27 " 1
300	700	16 " 17	23 " 1
200	800	16 " 17	20 " 1
100	900	16 " 17	18 " 1
Pure copper.	1000	16 " 17	16 " 1

The metallurgic chemist, while performing an A., can determine, by the examination of the stains on the cupel after the process has been finished, what metal may have accompanied, and been separated from, the silver, even in minute quantity. Thus, lead alone imparts a straw-yellow or orange stain; copper, a gray or dark-brown tint; and iron, a black stain.

During the A. of silver by the foregoing or *dry* method, a certain loss of metal generally occurs, which averages 2 parts in 1000; and this circumstance has induced the authorities in the mints of Great Britain, France, and other European kingdoms, as well as the United States, to adopt a *humid* process for the A. of silver, which will determine the value of a silver alloy to within 0.5 (or half a part) in 1000. The humid or wet A. consists in dissolving the compound of silver in nitric acid of density 1.25, and thereafter adding a solution of common salt (chloride of sodium,  $NaCl$ ), which causes the precipitation of the chloride of silver ( $AgCl$ ) in white flocculi. The common salt is made of a definite strength, and is poured out of a measured or graduated vessel, till all further precipitation of the silver ceases, when the amount required of the solution of common salt is read off, and by a simple calculation its equivalent in pure silver is obtained.

The A. of gold ores is conducted in a manner similar to that of silver. When the ore contains gold, lead, and copper only, it suffices to mix more lead with it, and heat in the cupel in the muffle furnace, when the lead and copper sink into the cupel, and the gold forms a globule on the upper surface. The proportion of lead required is regulated by the amount of copper present in the alloy.

Proportion of gold contained in one part of the alloy.	Quantity of lead necessary to completely remove the copper by cupellation.
1000 thousands	1 part.
900 "	10 parts.
800 "	16 "
700 "	22 "
600 "	24 "
500 "	26 "
400 " and under.	34 "

When the gold is accompanied by silver as well as copper, iron, and lead, it is necessary in the first place to subject the alloy to the A. process in the ordinary way, which

gets rid of the copper, iron, and lead, but leaves the silver still incorporated with the gold. The weight of this residual button gives the combined weights of the silver and gold present in the alloy. The method of separating the silver from the gold is called *parting*, and consists essentially in acting on the alloy with hot nitric acid, which dissolves away the silver, forming the soluble nitrate of silver ( $\text{AgONO}_2$ ), and leaves the gold undissolved. When the silver is present in small proportion, the gold assumes a protective influence, and keeps the nitric acid from acting on the silver; and to effect this separation satisfactorily, it is necessary that there should be about three parts of silver to one of gold. As that proportion does not occur naturally, or in any kind of manufactured gold-plate, it is requisite to incorporate some silver with it. This is generally accomplished by taking the proper quantities of gold and silver, wrapping them up in a piece of lead-foil, and heating on a cupel. The lead, during its disappearance from the heating vessel, causes the most intimate amalgamation of the silver and gold, which are left on the cupel as a metallic button. The latter, on being allowed to cool, is beaten out on an anvil with a smooth hammer, and is then passed through steel rollers, which yield a ribbon of alloy about the thickness of an enameled address-card. The ribbon of metal being coiled up, is technically called a *cornet*, and when introduced into the flask with nitric acid, the entire solution of the silver is accomplished, whilst the gold is left as a brown-colored spongy mass, of the shape and size of the cornet. To give the metal the appearance and compactness of ordinary gold, the very friable metallic ribbon is gently transferred from the *parting glass* to a crucible by inverting the former into the latter; and the liquid which runs in with the gold being poured off, the crucible and its contents are raised to a red heat in a furnace, when the gold recovers its beautiful yellow color and metallic luster, and at the same time becomes soft and flexible. The gold is now pure, and in a fit condition to be weighed, and the amount obtained indicates the proportion of pure gold in the original alloy. As the quantity of silver which is required to be present during this process, in order that the *parting* by nitric acid may readily take place, is three parts of silver to one of gold, it is customary to call this department of a gold *A. quartation* or *inquartation*.

During the *A.* of silver or of gold, it is necessary to guard against any sudden increase or decrease in temperature. Independently of the probable loss of metal through the fracture of the cupels, it is found that when the final buttons of pure metal are obtained on the red hot cupel, if great care be not taken to cool the whole very slowly, the bead of gold or silver *spits*, and little portions are thrown off.

The mode of assaying gold now described cannot always be followed out in the examination of jewelry and other manufactured articles, as, though only a few grains are required for the *A.*, yet the removal of such might entail the destruction of the article, and in such circumstances the *touchstone* is resorted to. This stone was originally brought from Lydia in Asia Minor, and consisted of a cross-grained quartz saturated with bituminous matter, but black basalt and other stones are now employed for the same purpose. The manner of using the stone is to draw a streak upon it with the auriferous article; and from the color of the streak the richness of the gold can be very accurately determined by the practiced assayer. The subsequent action of nitric acid on the golden streak serves still further as a means of determining the purity of the metal, as the acid readily dissolves the copper and silver, and leaves the gold.

**ASSA'YE**, a village in the territory of the Nizam, lat.  $20^{\circ} 18' \text{ n.}$ , and long.  $75^{\circ} 55' \text{ e.}$  It stands in the doab, or fork, of the Juah and Kaitna. *A.* claims notice chiefly as the scene of the first great victory of the duke of Wellington, then major-gen. Wellesley, won on the 23d Sept., 1803. The British troops in action were only about 4500, while the Mahrattas under Scindia and the rajah of Berar numbered 50,000, of whom 10,000 were commanded by French officers. Ninety-eight pieces of cannon, 7 standards, all the baggage, and a large part of the ammunition of the Mahrattas fell into the hands of the conquerors, whose military supremacy was soon acknowledged over a great portion of India. In 1851, a medal was struck in commemoration of the victory.

**ASSEERGHUR**, a fort situated on an isolated mountain at the n.e. angle of the presidency of Bombay, in lat.  $21^{\circ} 26' \text{ n.}$ , and long.  $76^{\circ} 26' \text{ e.}$  Its elevation above the base of the mountain is estimated at 750 ft. Its extreme length and breadth are respectively 1100 and 600 yards; from the irregularity, however, of the outline, the area is computed at not more than 300,000 square yards, or somewhat less than one tenth of a sq. m. With the exception of two avenues of ascent, both of them difficult and strongly fortified, the space is everywhere terminated by a carefully scarped precipice, varying in height from 80 to 100 ft. This formidable fastness has been twice taken by the British—first in 1803, and finally in 1819.

**AS'SELYN, JAN**, 1610-60; a Dutch painter, pupil of Isaiah Vandervelde, and distinguished in landscape and animal pictures. He was one of the first Dutch artists to introduce Claude Lorraine's fresh and clear manner. There are several of *A.*'s pictures in the galleries of Amsterdam.

**ASSEMA'NI, JOSEPH ALOYSIUS**, 1710-82; brother of Stephen. He followed in the same studies, rising to be professor in the *sapienza*, at Rome. He was the author of two religious works.

**ASSEMA'NI**, JOSEPH SIMON, 1687-1768; a philologist of Syria. He was a collector of oriental manuscripts for the vatican library, and the custodian of the collection. He was versed in eastern languages, and wrote two or three bibliographical works, besides editing the *Opera Ephraemi Syri*.

**ASSEMA'NI**, SIMON, 1752-1821; he was remotely related to the other noted men of the name, and like them an orientalist, paying especial attention to numismatics, on which theme he published a volume. He was also professor of languages at Padua.

**ASSEMA'NI**, STEPHEN EVODIUS, 1707-82; nephew of Joseph Simon. He followed his uncle's studies, and was also librarian in the vatican, but was promoted to be archbishop of Apamea. He left a work on oriental manuscript literature, and one on martyrology.

**ASSEMBLY** (*assemblée*), in the conduct of an army, is the second beating of the drum before a march, at which the soldiers strike their tents if encamped, roll them up, and stand to arms.

**ASSEMBLY, GENERAL**, in Scotland, Ireland, and the United States, denotes the highest court of the Presbyterian church. It differs from the Anglican convocation at once in its constitution and in its powers, representing as it does both the lay and the clerical elements in the church, and possessing supreme legislative and judicial authority in all matters purely ecclesiastical. The general A. of the established church of Scotland consists of representatives, clerical and lay, from all the presbyteries of the church. The royal burghs of Scotland also return elders to the general A. of the established church, and each of the Scottish universities sends a representative. The A. meets once a year, in the middle of May, at Edinburgh, and sits for 10 days. Its deliberations are presided over by a moderator, whose election is the first step in the proceedings, after a sermon by his predecessor. In former times, this office was sometimes filled by laymen: among others, in 1567, by George Buchanan. In modern times, the moderator is always a clergyman. 84 presbyteries, composing 16 synods, return members to the general A. of the established church of Scotland. Its relation to the state is represented by a royal commissioner, who exercises no function in the A. beyond that of adding by his presence the sanction of the civil authority to its proceedings. The other functionaries are a principal and a deputy clerk, both clergymen, a procurator, and an agent. All business not dispatched during the session of the A. is referred to a commission, with the moderator as convener, which meets immediately after the dissolution of the A. and again quarterly. The general A. of the free church of Scotland, which has 16 synods comprising 71 presbyteries, and of the Irish Presbyterian church, is similarly constituted, the principal point of difference being the absence of the royal commissioner. See **PRESBYTERY**, **SYNOD**, **BARRIER ACT**, etc.

**ASSEMBLY, NATIONAL** (France). The states-general (q.v.), convoked by Louis XVI. of France, and opened May 5, 1789, consisted of the two privileged orders, clergy and nobles, and of the tiers-état or commons. The privileged orders refusing to join the third estate and deliberate in a common chamber, the latter, of its own authority, June 17, assumed the title of *Assemblée Nationale*, and the right to act in the name of France. The court attempted to annul this resolution in a royal sitting, June 23; but the deputies of the third estate, along with the liberal members of the other two orders, had bound themselves by oath not to separate until they had given France a constitution, and had declared every attempt at violence on the part of the court, treason. They refused to quit the common hall, and the court yielded, and commanded the nobles and clergy to join the national A. This was the beginning of the revolution, and the A. proceeded with astounding rapidity to metamorphose old France. The abolition of all privileges on the 4th of Aug. was followed by that of hereditary jurisdiction, and of restraints on religion and the press, and by the declaration of the rights of man (q.v.). In Feb., 1790, the monastic orders were suppressed, and all remnants of feudalism swept away; in March, *lettres de cachet* and the oppressive salt-tax were abolished; in June, all orders and titles of nobility. In July, non-Catholics had the property confiscated from their ancestors restored; Jews were relieved from personal taxation; and game-laws done away. A decree of Oct. 18 abolished the cruel criminal penalties of Louis XIV. In Jan., 1791 all corporations and guilds were abolished, and free-trade introduced. In Feb., political rights were conceded to Quakers; in May, the customs at city gates were abolished; in June, the torture; the violation of the secrecy of letters was also declared criminal. In Sept., all citizens, of whatever color or religion, received political rights.

The principles on which the assembly proceeded were the sovereignty of the people, the independence of the communes, the limitation of the royal power through a conditional veto (q.v.), the separation of the political authorities, and the responsibility of ministers. Accordingly, the A., shortly after it was constituted, declared that to it alone, subject to the royal veto, belonged the legislative power. Several decrees, in Sept., 1789, determined that the legislative body should form only one chamber, and should be renewed every two years; other decrees declared the king inviolable, and the throne inalienable. A decree of 7th Nov. forbade the deputies to undertake the place of ministers; in Dec., the new organization of the communes was begun. Jan., 1790,

France was divided into departments; in April, trial by jury was introduced; in May, it was declared that the right of war and peace belonged to the nation alone, that is, to the A.

In regard to finance, which had been the immediate cause of the assembly's being convoked, the reforms were equally thorough. It was decreed at the outset that taxes were to be apportioned and raised without regard to rank or person. Then followed the approval of a loan of 80 millions of francs. A decree of Nov., 1789, ordered the publication of the public accounts; another in Dec. established a national bank. In Mar., 1790, appeared the first law sanctioning the sale of 400 millions' worth of the national domains; and in April, another ordering the issue of *assignats* (q.v.) on the national property; in Oct., these assignats were declared to bear no interest. These measures were followed, in the beginning of 1791, by a series of laws regarding coining, taxation, encouragement to industry, revenue-management, etc. A committee of the A. appointed to reform church matters, made a complete overturn of the old ecclesiastical system. After a declaration that Catholicism had ceased to be the state religion, tithes were abolished, and church property confiscated. Church ornaments and valuables were appropriated as patriotic gifts to the state; the civil jurisdiction of the bishops was taken away, and monks and nuns were freed from their vows. The clergy were put under a civil constitution. Each department was a see, and the communes ruled and paid bishop and curés. All the clergy were amenable to the civil courts, without appeal to the pope or the interference of any ecclesiastical authority whatever. Every clergyman had to take an oath accepting this constitution, which led to the emigration of a number, and subsequently to enactments of excessive rigor against refractory priests (*prêtres insermentés*).

The A. having thus laid the revolution on a foundation of 3250 decrees, and having sworn to the new constitution, and got it accepted by the king, closed its sittings, Sept., 30, 1791. From its having framed the constitution (which lasted only 12 months), this assembly is usually called the constituent A. It made way for the LEGISLATIVE ASSEMBLY, which was to reform the civil and criminal laws in accordance with the spirit of the new constitution. A decree had provided that no member of the constituent should be returned to the legislative A. But the democratic party received such preponderance at the elections, that the A. forgot its mission from the very first, and commenced a war with the remnants of the royal authority, which ended, Aug. 10, 1792, with the overthrow of the throne and the suspension of the king. The constitution had provided for an appeal to the nation in extreme cases, and the legislative A. now exercised that right by convoking a *national convention* (q.v.), which, being invested with the powers of the sovereign, was to decide on the fate of the monarchy, and remodel the whole political system.

The title of national A. has been assumed by various other parliamentary bodies, originating in popular commotions, and aiming at radical political changes; as the French A. that met after the revolution of Feb., 1848, followed, April, 1849, by a legislative A.; the German national A. at Frankfurt; and the Prussian national A. Under the existing French republic, the senate and the chamber of deputies unite to form the national A.

**ASSEMBLY OF DIVINES**, or WESTMINSTER ASSEMBLY, a celebrated convocation appointed by the long parliament for settling the doctrine, liturgy, and government of the church of England. It consisted of 120 clergymen and 30 laymen—10 of whom were lords and 20 commoners—together with 4 clerical and 2 lay commissioners from the church of Scotland. Among the more distinguished of the divines were Usher, Saunderson, Reynolds, Brownrigg, Ward, Twisse, Lightfoot, Gataker, Burges, Goodwin, Calamy, and Nye; of the laymen, Selden, Prideaux, the two Vanes, Rouse, Pym, Whitelocke, St. John, and Maynard. The Scottish divines were Henderson, Gillespie, Rutherford, and Baillie. 25 of those whose names were contained in the ordinance calling the assembly, which was dated 12th June, 1643, never appeared at the discussions, one or two of them having died about the time of the first meeting, and the others fearing the displeasure of the king. To supply the place of these absentees, some additional members, called the superadded divines, were summoned to attend. This notable assembly held its first meeting on the 1st of July, 1643, and continued to sit till the 22d Feb., 1649, during which time it had met 1163 times. Its most important work was concluded long before that time. One of the first things it did was to give its sanction to the *Solemn League and Covenant*, against which Dr. Burges alone stood out for several days. The Presbyterians formed a large majority in the assembly, and exercised a corresponding influence on its decisions. In doctrine, the members were almost unanimous; but on the subject of church government, opinions extremely opposite were maintained with keenness, especially on the question touching the sphere and limits of the civil power in matters ecclesiastical. The principal fruits of its deliberations were the *Directory of Public Worship*, submitted to parliament April 20, 1644; the *Confession of Faith*, Oct. and Nov., 1646; the *Shorter Catechism*, Nov. 5, 1647; and the *Larger Catechism*, Sept. 15, 1648. These several formularies, which contain a clear and rigid embodiment of Calvinistic theology and Presbyterian church government, constitute to this day the authorized standards of the Presbyterian churches of Scotland, Ireland, and England. The *Directory of Public Worship* was ratified by both houses of parliament, Oct. 2, 1644, and the doctrinal part of the *Confession of Faith* in Mar., 1648. An order of the house of commons, Oct. 13, 1647, ordained that the Presbyterian form of church government

should be tried for a year, but no further legislation followed. What has hitherto been known as to the details of the proceedings of this remarkable convocation, has been derived chiefly from the *Letters of Baillie*, and *Lightfoot's Journal*.—See Hetherington's *History of the Westminster Assembly* (1843); and the 2d volume of Masson's *Life of Milton*, published in 1871 (pp. 509–527), where a list of the members, with brief biographic notices, is given.

**ASSEN**, a t. in the Netherlands, 15½ m. by rail s. of Groningen; pop. '67, 6443. A. is on the Horn-Diep, and has canal communication with the Zuyder Zee. Certain tumuli near the place are called "giants' graves."

**ASSENT, ROYAL**, is the regal act by which the sanction of the crown to bills which have passed through both houses of parliament is given. See **ROYAL ASSENT**.

**ASSER**, JOHN, the learned and congenial biographer of Alfred, was a monk of St. Davids, from the Latin name of which, *Menevia*, he is termed in the old records *Asserius Menevensis*. About the year 880, his reputation for learning and piety procured him an invitation to the court of Alfred, where he resided at intervals during the rest of the king's life, assisting him in his studies, and enjoying an affectionate confidence, of which he seems to have been every way worthy. The king promoted him to various dignities, and finally made him bishop of Sherburn. The *Saxon Chronicle* fixes the date of his death in the year 910. Several works have, with more or less authority, been attributed to A. The only one undoubtedly his, by which we can now judge of him as a man and a writer, is his *Annales Rerum Gestarum Aelfredi Magni*. This simple and most interesting narrative was first published in 1574 by archbishop Parker. Its trustworthiness has recently (1842) been questioned by Mr. Thomas Wright, in the article "Asser" of his *Biographia Britannica Litteraria*. This gentleman has assuredly made the most of the objections to its reliability that can be legitimately urged. Lingard and Dr. Pauli have replied to these, and, at present, the general impression of scholars of Anglo-Saxon literature is that there is no good reason for doubting its general accuracy and fidelity. The best edition is that of Wise (Oxf., 8vo., 1722).

**ASSES, FEAST OF**. See **FOOLS, FEAST OF**.

**ASSESSED TAXES**. These are duties assessed and charged upon the people, under the authority of numerous acts of parliament, beginning with the 43 Geo. III. c. 99. The duties now comprised under this branch of taxation are those on inhabited houses, male-servants, carriages, horses, and mules, dogs, horse-dealers, hair-powder, armorial bearings, and game. The duty on inhabited houses was substituted, by the 14 and 15 Vict. c. 36, for a former tax on windows. The A. T. are under the management of the commissioners of inland revenue. See **TAXES**.

**ASSESSORS** may be defined as persons who are sometimes associated with judicial functionaries, to assist in the argument and procedure before them, and to advise their judgments. They are called A., because, according to the Latin derivation and literal meaning of the word, they sit *side by side* with others. They may be usefully employed by persons in judicial stations whose previous education and pursuits scarcely qualify them for the duties cast upon them. A. are usually barristers or advocates learned in the law, and familiar with judicial proceedings. By the 5 and 6 William IV. c. 76, commonly called the municipal corporation act, it is, by section 37, enacted that the burgesses shall annually elect from among those qualified to be counselors, two auditors and two A., the former to audit the accounts of the burgh, and the latter to revise the burgess list. In the ecclesiastical law of England, a bishop, who is a spiritual judge, is assisted by his chancellor, as the episcopal assessor, and who, in fact, holds courts for the bishop. But in the case of a complaint against a clergyman, for any ecclesiastical offense under the church discipline act (the 3 and 4 Vict. c. 86), the bishop is directed to inquire into the matter, assisted by the three A., of whom the dean of his cathedral, or one of his archdeacons, or his chancellor, must be one, and a sergeant at law, or an advocate who has practiced five years in the court of the archbishop of the province, or a barrister of seven years' standing, another.

The judges of the common law courts, and the queen's counsel, being sergeants, are, as a condition of their offices, A. of the house of lords, advising the house on points of law which may be propounded to them by their lordships.

**ASSETS**. This is one of those terms in the law of England which in itself bears evidence of a Norman origin. It is derived from the French word *assez*, or more exactly, in Norman-French, *assetz*, "enough" or "sufficient," signifying the property of a deceased person, which is sufficient in the hands of his executor and heir for the payment of his debts and legacies. In strictness, therefore, the term is not applicable to the property of a person who dies intestate, and without any debts to be paid. In general acceptance, however, it is understood to mean the property left for distribution by a deceased person, whether testate or intestate; and in commerce, and also in bankruptcy and insolvency, the term is used to designate the stock in trade and entire property of all sorts belonging to a merchant or to a trading association.

A. are either *personal* or *real*, the former comprehending such goods, chattels, and debts as devolve on the executor; and the latter including all real estate, whether devised or descending to the heir at law. In connection with this distinction, A. are also said

to be *A. by descent*, and *A. in hand*, the former of these being recoverable from the heir to whom the land descends, and so far as such lands will extend—*A. in hand*, again, signifying such property as a person leaves to his executors sufficient for the clearing of burdens and bequests affecting his personal estate. *A.* are also in their nature either *legal* or *equitable*, according to the nature of the remedy which may be used by creditors against the executor or heir. Where there are several creditors of equal degree, the executor is bound to pay him who first obtains judgment for his debt; and he cannot resist on the ground that nothing will be left for the other creditors. If, after exhausting the whole *A.* which have come to his hands, by the payment of debts in due order, he be afterwards sued by a creditor remaining unpaid, he is entitled to protect himself by an allegation that he has fully administered, or technically by a plea of *plene administravit*; and upon this plea the creditor is entitled to judgment that he shall be paid out of any other *A.* that shall come to the defendants, which is called a judgment of *A. in futuro*.

*A.* is not a technical term in Scotland, but it is nevertheless much used in the legal business of that country.

**ASSID' IANS.** See CHASIDIM.

**ASSIEN TO**, i.e., treaty, a word specially applied to a compact between Spain and some foreign nation, according to which the Spanish government conferred upon the latter, under certain conditions, the monopoly of the supply of negroes for its American colonies. It was Charles I. of Spain who first concluded an *A.* with the Flemings. Next, a similar compact was entered into with the Genoese (1580 A.D.), the Portuguese (1696), and on the accession of Philip V. to the Spanish throne in 1702, with the French Guinea company, which from that time took the name of *A.* company, upon the understanding that for ten years it should have the exclusive right of annually importing 4800 negroes of both sexes to the continent and islands of Spanish America. The *A.* was next transferred to England at the peace of Utrecht in 1713, and made over by government to the South Sea company for 30 years, permission being also granted to the company to send yearly, during the term of contract, a ship, carrying 500 tons of goods, to these Spanish colonies. The misunderstandings that grew out of this last clause contributed not a little to the war that broke out between the two nations in 1739. At the peace of Aix-la-Chapelle in 1748, the English company having still four years to run, their rights were guaranteed to them; but they relinquished them at the Madrid convention of 1750, upon the payment of £100,000, and the concession of certain commercial advantages.

**ASSIGN**, To, in law, signifies to transfer or grant over to a third party a security, a right of credit, or other right, whether in possession or in reversion, granted by a party indebted or under obligation to the party assigning. The words of assignment are to *A.*, *transfer*, and *set over*, and they operate to transfer both real and personal property. A *chase in action* (q.v.), contrary to the ancient principle, can now be assigned in England indirectly by the common law, and directly according to the principles recognized in the practice of equity. Besides this general application of the word, as a technical term in conveyancing, both in England and Scotland, it is also employed in England in judicial procedure, where the decision of an inferior court is brought under review, and in proceedings in bankruptcy. See ASSIGNMENT, ASSIGNATION, ASSIGNMENT OF ERROR, BANKRUPTCY.

**ASSIGNATION** is a legal term in Scotch conveyancing, analogous to the English word assignment (q.v.), by means of which the holder of any right, or the creditor in any obligation, or the proprietor of any subject not properly feudal (see FEUDAL SYSTEM), transfers his right or estate to a third party. The party making the *A.* is called the *cedent*, and the party in whose favor the *A.* is made is called the *assignee* or *cessionary*, and the act of assignment thus made is irrevocable, an element in the deed which has been traced to the practice of the French law, a source from which the Scotch lawyers of the 16th c. borrowed so much—the court of session itself being a mere copy of the parliament of Paris. A direct conveyance of a debt in France was termed *un transport*; the granter, *cedant*; and the grantee, *cessionnaire*; and these terms, derived from a Latin origin, were introduced into the Scotch law; and hence the names of the parties to an *A.*, as we have stated. Unlike the English common-law view of the assignment, the Scotch *A.* has the effect of investing the assignee with the whole right, which was in the cedent, although according to the ancient practice, the *A.* gave, not simply the sum or subject assigned, but also the deed or written evidence of the right or thing assigned, a form arising from the circumstance of the instrument having been regarded as of the nature of a mandate or power of attorney to the assignee to make his claim and to act as in right of the cedent. In modern practice, however, it is usual to employ simply the terms "assign, convey, and make over," which correspond with the real character of the deed. In order, however, to complete the *A.*, it must be *intimated* to the common debtor—that is, the party originally indebted to the cedent—and so essential is this intimation, that in the case of competing claims against the right interest or estate assigned, the *A.* first intimated will be preferred to one prior in date, but posterior in the date of intimation. Such intimation ought to be made by a *notary public* (q.v.), but other formal notice of the *A.* is sometimes admitted. But there are certain assignments which require no intimation, such as the indorsement of bills of exchange, adjudication (q.v.), which is a judicial *A.*, and marriage, which is a legal *A.*; and the same is the rule with regard to all right and

estate assigned under the operation of the bankruptcy laws. In Scotch agricultural leases, assignees are generally excluded expressly.

But although A. is the strict Scotch term for assignment, the latter is in Scotland the technical term for the transference of certain property, such as property in copyrights, patents, and registered vessels.

**ASSIGNATIONS**, paper currency of Russia, issued by Catherine II., about 1770, to assist in carrying on the war against Turkey. Like similar experiments in other countries before and afterwards, the A. started at par, but rapidly declined to less than 25 per ct. About 20 years later, the A. were the general currency; but traders began to refuse them, and the most stringent edicts of Paul failed to force them into good standing. In the war with Napoleon, heavy issues were made, the value keeping steadily at about four roubles of paper to one of silver. The rate rose somewhat after the peace, and fluctuation became so troublesome that the government fixed the value by special law. In 1829, the silver rouble was made the unit, and the value of A. fixed at  $3\frac{1}{2}$  for 1 of silver. At the same time bills of credit were issued which have taken the place of the A.

**ASSIGNATS**. After appropriating to national purposes the land belonging to the church, the French national assembly (see **ASSEMBLY, NATIONAL**), instead of bringing it into the market at a time of insecurity, when its value was depreciated, issued bonds on the security of it, which were called *assignats*, as representing land assigned to the holder. This paper-money consisted chiefly of notes for 100 francs (£4) each, though many of them were for sums as low as ten or five francs, and even lower; and the first issue amounted to 400,000,000 francs. The first A., which were issued in the spring of the year 1790, bore interest; but subsequent issues did not. The facility of this plan of providing government income led to its being repeatedly had recourse to, as the property of wealthy emigrants—persons who abandoned their country in alarm—fell into the hands of the rulers, and was confiscated, till the amount rose to the enormous sum of 45,578,000,000 francs, besides a great number of forged A. manufactured abroad, and smuggled into the kingdom. The value of the A. naturally soon began to decline, and confidence once gone, the declension became fearful. In June, 1793, 1 franc in silver was worth 3 francs in paper; in Aug., it was worth 6. The state took the most extreme measures to compel the acceptance of A. at their full nominal value. The effects of these were to cause the A. to flow back into the public treasury, to raise the prices of all commodities, and to make every one averse to have any dealings with the state. One of these consequences was attempted to be met by fixing a maximum of prices. But no one could compel producers and dealers to produce and sell at a loss; so that all business became disorganized. At last the value of A. came almost to nothing. Millions of individuals had suffered incalculable loss, and only a few, who had bought public lands with the A. that cost them little or nothing, had enriched themselves at the expense of the community. In Mar., 1796, a louis d'or (24 francs) brought 7300 francs in A. After this, they were withdrawn from the currency in 1796, and redeemed at  $\frac{1}{10}$ th of their nominal value, by *mandats*, a new kind of paper-money, which enabled the holder at once to take possession of public lands at the estimated value, while A. could only be offered at a sale. The *mandats* also soon fell to a seventieth of their nominal value, and were returned to government in payment of taxes or of land.

At length, in July, 1796, the system of paper-credit, so obstinately persisted in by government and so disastrous in its results to the public, came to an end. A law was passed, declaring that every one was entitled to transact business in whatever circulating medium he pleased; that the *mandats* should be taken at their current value; and that the taxes be received either in coin or *mandats* at that rate. The A. were executed on a coarse kind of paper, and the devices were so meager as to be easily counterfeited.

**ASSIGNEE IN BANKRUPTCY**. See **BANKRUPTCY**.

**ASSIGNMENT**, in the law of England, is the name given to a conveyance by which the party making the A. transfers or grants over, for a sufficient consideration, a right in expectancy, in reversion, or other right not in possession, such as a bond, a debt, or other *chose in action* (q.v.). In England, according to the strict rule of the old common law, no such right could be assigned or granted over, because such a proceeding was thought to be an encouragement to litigation. The only exception to this general rule was in the case of the crown, which might always either grant or receive a *chose in action* by A. Now, however, the proceeding is in constant practice. The courts of equity used to make the rule itself give way to the expediency of facilitating the transfer of property by directly sanctioning the practice; and even in those of common law the application of the ancient principle was evaded. Mortgages may be assigned; indeed the right to make such a transfer is one of the properties of a mortgage security. A. is also the proper mode of assurance or conveyance for passing leasehold estates for years, and other chattel property; and by the 8 and 9 Vict. c. 106, s. 3, it is enacted that all assignments made after the 1st of Oct., 1845, not being an interest which before the passing of the act might have been created without writing, shall be void at law, unless made by deed. But a mere note in writing, if duly signed by the parties, will nevertheless be supported in equity as an agreement, and pass an equitable interest to the assignee. It also appears that a parol or verbal lease for a term not exceeding three

years, nor valid as such within the statute of frauds (q.v.), may be assigned by a simple note in writing, if impressed with a proper stamp. Copyright is assignable; indeed, by the 5 and 6 Vict. c. 45, s. 3, copyright is expressly given to the author *and his assigns*; but it is not required, like a patent right, to be in every case under the seal of the proprietor, it being enacted by section 13 of the same act that an A. properly entered in the book of registry at stationers' hall shall be as effectual as if made by deed.

In regard to the right of A. generally, it may be laid down that the property in things personal is transferable with absolute freedom; and if they are assigned under a condition which is either repugnant to the gift itself, or against the policy of the law—such as a prohibition to dispose of the property assigned—the condition is void. There are some cases, however, where the right of alienation is, in respect of the incapacity of the owner, suspended; as to which it will be sufficient to remark that the law with respect to the disability of infants, insane persons, and persons under duress, applies in general to personal as well as to real property. A married woman, too, is in general under an absolute incapacity to make any transfer of things personal; for, with the exception of her equitable interest in property settled in trust expressly for her separate use, the goods and chattels which she may have possessed at the time of marriage, or subsequently acquired, belong, by the general rule of law, to her husband. There are also some few cases where, in respect of the nature of the interest itself, its alienation is absolutely prohibited. Thus, generally, the pay or half-pay of a military or naval officer, or the salary of an officer of trust, is, on a principle of public policy, not assignable, the object being to secure to such persons, even against their own improvidence, the possession of those means which are essential to the maintenance of their station and the performance of their duties. The sale or transfer of public appointments themselves is also, in general, contrary to the policy of the law, and in most cases expressly prohibited. See Stephen's *Commentaries*, vol. ii., p. 43.

An A. of goods and chattels is frequently made by a bill of sale (q.v.). Bills of exchange (q.v.) and promissory notes (q.v.) are assigned by indorsement.

The corresponding term in the Scotch law is *assignation* (q.v.). But in that system A. is the legal and technical word for the transference of property in copyrights, patents, and registered vessels.

**ASSIGNMENT** (*ante*), in American law, a transfer or making over (in writing usually) to another of property in possession or in action, or of any right therein; or the transfer of one's interest in property. Almost any valuable thing, present or prospective, may be assigned; but there are things excepted, such as the commission or pay of a public officer, the salary of a judge, right of action for fraud, rights *pendente lite*, personal trusts, or the duties of a guardian. To be valid in law, the subject of A. must at the time have an actual or prospective existence, although courts may hold an A. good where value rests on possibility only. Negotiable bills are assigned by mere indorsement, and then the holder can sue in his own name. In such case even an equitable defence that might exist between the maker and the original acceptor is barred out. The majority of assignments are made by insolvent debtors for the protection of creditors, and to obtain discharge from further obligation, and these are regulated by special statutes in most of the states. In some of these an A. must be for the benefit of all creditors equally. Personal chattels are usually transferred by bills of sale; sometimes by mere memorandum; any words showing the intent will answer. No consideration is necessary to support A. of a term. An A. of a policy of insurance, by consent of the underwriter, by statute, or otherwise, vests in the assignee all the rights of the assignor; but as such an instrument is not negotiable, the A. is only in equity, and even that may be forestalled by condition to the contrary expressed in the policy. An A. of dower is an act by which the share of a widow in a deceased husband's real estate is set apart for her, and may be made by the heir or his guardian, or the person in possession of the land subject to dower; or after legal proceedings by direction of the court, if voluntary A. be refused.

**ASSIGNMENT OF ERROR** is the technical statement of certain grounds on which the judgment of a court of law is sought to be reviewed by a higher tribunal; but by the common law procedure act (15 and 16 Vict. c. 56, s. 152), it is now limited to the case where the defendant in error intends to rely in support of the judgment on the proceeding in error being barred by lapse of time, or by release of error, or other like matter of fact. See **APPEAL** and **ERROR**.

**ASSIGNS**, or, in Scotch law, **ASSIGNEES**, is the legal name given to parties in whose favor an assignment or assignation (q.v.) is made.

**ASSIMILATION**. See **NUTRITION**.

**ASSING**, LUDMILA, b. 1827; a German biographer, the daughter of Dr. A., and niece of Varnhagen von Ense. She was taken by her uncle after the death of her parents, and filled the place of a child to him, receiving thereby a superior education. She wrote for newspapers and reviews, and in 1857 a biography of Elisa, countess Von Ahlefeldt. She edited and published, after her uncle's death, two vols. of his *Denkwürdigkeiten*; in 1860, Alexander von Humboldt's letters to, and in 1861–62, the diaries of Varnhagen von Ense. The political matter in the diaries so offended the court, that she

was prosecuted as a traducer of the royal family and other persons, and sentenced to eight months' imprisonment. But she had gone to Florence, and the punishment could not be inflicted. She immediately published the remaining volumes of the obnoxious diary, to which the court answered by the form of a trial and sentence to further imprisonment for two years.

ASS'ING, ROSA MARIA, 1783-1840; a German poetess, sister of Varnhagen von Ense. When young she was a teacher. In 1816, she married Assing, a physician in Königsberg, who took her to Hamburg, where her house soon became the resort of literary people, of whom one of the most eminent was the poet Chamisso. Mrs. A.'s poems were issued in a volume a year after her death.

ASSINIBOINE, a river of British North America, rising in lat. 51° 40' n., and about long. 105° e. Near lat. 50° n., and long. 96° w., at Fort Garry, it falls from the n.w. into the Red river (q.v.), which discharges its waters into lake Winnipeg. At a point 140 m. from its mouth, the A. is 230 ft. broad; its course measures about 400 miles. The river gives name to a tribe of Indians partly in Canada and partly in the United States. See RED RIVER SETTLEMENT.

ASSINIBOINS, an Indian tribe of the Dakota family, dwelling in the United States and British America, on the Montana border. They were once a part of the Yankton Sioux nation, but separated from them nearly 300 years ago, and since then have generally been their antagonists. It is said that the name A. is not used, other Indians calling them Stone Sioux, or Assinipwalak. There are about 5000 in the United States, and rather more in British America, where they extend from Mouse river to the Athabasca. The Methodists and Roman Catholics have missions among them.

ASSISI (*Assisium*), a t. of central Italy, is built upon a steep hill, in 43° 5' n. lat., and 12° 33' e. long. Pop. 14,033. It stands in a singularly picturesque situation, and is surrounded by a wall flanked with towers, and overhung by a lofty citadel in ruins. It is the birthplace of St. Francis, who here founded the convento sacro, the first monastery of the mendicant order that bears his name, a large and beautiful structure, and one of the earliest specimens of the Gothic style of architecture in Italy. The church and the galleries of the monastery contain fine paintings by Cimabue, Giotto, and other old masters. Besides the convento sacro, there are 11 other monasteries in A. Of these, the largest is the portiuncula, which has a richly decorated church, with a cupola by Vignola. In the last century, this place was a great resort of pilgrims, visiting the tomb of the saint, of whom 100,000 are said to have been assembled here on one day.

A. occupies the site of the ancient Assisium, a municipal t. of Umbria, and presents the remains of the forum, the baths, and the aqueducts of the days of the Romans. In the piazza, or square, there stands a beautiful portico of the ancient temple of Minerva, consisting of fluted Corinthian columns and a pediment. There are abundance of olive-trees, and some fine mineral springs in the vicinity. The t. has given title to a bishop since 240 A.D. It has manufactures of needles and files.

ASSISTANCE, WRIT OF, a direction by a proper court to the sheriff to put a party in whose favor judgment has been given, in possession of that to which the judgment declares him entitled.

ASSIZE. This word, literally signifying a "sitting" or "session," is a term used in the principal European legal systems, and very much in the same sense, or rather senses, in all, for it has more than one distinctive meaning. As is common with regard to most of our ancient legal technicality, the Latin language, in the first instance (*assideo*), and then the French (*assis*), appear to have led to its introduction into the phraseology of the law of England, and, it may be added, also of Scotland, although in the latter country it has a more limited application in judicial procedure than in England, A. being in Scotland the old technical expression for a jury. In England, this word may also signify a jury, and it is sometimes used to denote an ordinance, decree, or law. But in modern practice, it is commonly applied to the sessions or sittings of the judges of the superior law-courts, held periodically in each county, for the purpose of administering civil and criminal justice. These courts came into use in room of ancient justices in eyre, *justicia rei in itinere*. They are now appointed by commissions issued twice a year to the judges of the high court of justice, two judges being generally assigned to each circuit. (These are the *general* commissions; *special* commissions are occasionally granted to certain judges to try certain causes and crimes.) By accompanying writs of *association*, certain persons are directed to be associated with the justices and sergeants, in order to take the assizes, etc., that a sufficient supply of commissioners may never be wanting. But, to prevent the delay of justice by the absence of any of them, there is also issued, of course, a writ of *si non omnes*, directing that, if all cannot be present, any two of them (a justice or sergeant being one) may proceed to execute the commission. These commissioners or judges of A. are sent twice in every year on *circuits* all round the kingdom, to try by a jury of the respective counties the truth of such matters of fact as are then under dispute in the courts of Westminster hall; and occasionally a third circuit is appointed in the course of the year, for the purpose of jail delivery. The circuits are eight in number—such as the home, the midland, the Norfolk, the Oxford, the northern, the western, the north Wales, and the south Wales circuit; and in going them,

the judges or commissioners sit by virtue of four several authorities: 1. The commission of the *peace*; 2. A commission of *oyer and terminer*; 3. A commission of general *gaol* delivery. The other authority is, 4. That of *nisi prius*, which is a consequence of the ancient commission of A. being annexed to the office of justices of A. by the statute of Westminster the second (13 Edw. I. c. 80); and it empowers them to try all questions of fact issuing out of the courts at Westminster that are then ripe for trial by jury. These, by the ancient course of the courts, were usually appointed to be tried at Westminster in some Easter or Michaelmas term, by a jury returned from the county wherein the cause of action arose; but with this proviso, *nisi prius*, unless before the day prefixed the judges of A. should come into the county in question, which in modern times they have invariably done in the vacations preceding; so that the trial has always, in fact, taken place before those judges. And now, by the effect of the statute 15 and 16 Vict. c. 76 (the common law procedure act, 1852), the course of proceeding is no longer even ostensibly connected with a proviso at *nisi prius*, but the trial is allowed to take place without the use of any such words in the process of the court, and as a matter of course, before the judges sent under commission into the several counties. The circuit system, however, does not extend to London and Middlesex, which have instead courts of *nisi prius*, which are held before the chief or other judge of the superior courts for the trial of civil causes, at what are called the London and Westminster sittings; and the establishment of the central criminal court (by the 4 and 5 Will. IV. c. 36, the jurisdiction of which was extended by the 19 and 20 Vict. c. 16) has sufficiently provided for the administration of criminal justice within these districts. The judicature act (1873, ss. 11, 16, 29, 37, 77, 93, and 99) made no important alteration in the manner of holding assize.

The circuit courts of judicatory in Scotland, of which there are three—the north, the west, and the south—very much resemble the assizes in England, and have, in criminal matters at least, very much the same jurisdiction; but in civil causes their authority is very limited.

In the sense of an ordinance or law, the term A. has various applications, although chiefly in the more ancient systems of jurisprudence. Thus, the "assizes" of Jerusalem were, as we are told in Gibbon's *Decline and Fall* (vol. xi., p. 93), a code of feudal laws for the kingdom of Jerusalem, formed in 1099 by an assembly of the Latin barons and of the clergy and laity under Godfrey of Bouillon. Then there were the "assizes" or ordinances regulating the price of bread, ale, fuel, and other common necessities of life, but all of which have been abolished. The same regulations appear to have prevailed in Scotland in ancient times. See JURY TRIAL, FAIRS.

ASSOCIATED PRESS, a combination of daily newspapers originating about 1850 in New York to procure news by telegraph, or otherwise, and to share the expenses proportionately. Though the cost of dispatches is not a fourth of what it was when the A. P. was formed, the franchise is considered exceedingly valuable. There is also a western A. P., and other associations of less extent. In Europe the collection of news is practically a monopoly in the hands of the successors of baron Reuter.

ASSOCIATE SYNOD, ASSOCIATE PRESBYTERY, etc., designations adopted among the dissenters from the church of Scotland. See UNITED PRESBYTERIAN CHURCH. America has also an associate synod and an associate reformed church, both sprung from the Scottish secession.

ASSOCIATION. See CO-OPERATION; also, SOCIETIES, LEAGUE, COMPANY.

ASSOCIATION OF IDEAS. This is a phrase of great importance in the philosophy of the human mind, as expressing the most pervading fact at the foundation of our intelligence. By giving, therefore, a somewhat full exposition of this subject, we are able to explain, at once, a considerable number of the complex phenomena of mind in a more satisfactory way than by treating the several phenomena separately. What is meant by association of ideas, is familiarly illustrated by such occurrences as the following: When we see the sky becoming overcast, we think of rain as about to follow, the notion of rain not having previously been present to our mind. When we hear the church-bells, we are apt to think of the crowds in the street, or of some of the other circumstances of public worship. When we pass a house, we are reminded of its occupier; and meeting a person we know, we may be carried in thought to his office, and from that to other persons holding the same office, and so on. If an object is before my eyes, as a mountain, I am said to receive an impression or sensation of it, in consequence of the actual presence of the thing; but it is possible for me to remember the mountain, or to have an idea of it, when far away from the reality, in which case there must be some power in the mind itself, different from the susceptibility to present objects, a power of retaining, reviving, or resuscitating those states at first induced by contact with the actual. Besides the sights, and sounds, and touches caused by contact with real things, we are greatly occupied with sights, sounds, and touches remembered, anticipated, or imagined, which is to live in a world of ideas; and it is in this world that the process termed association has its sphere. When an idea is brought before the mind without its original, as when I picture to my mind the late duke of Wellington, the circumstance is owing to the mention of his name, or of some incident connected with him; and my remembrance of his personal appearance, as I have seen him when alive, is said to be the result of an association existing in my mind between two ideas, so that the one is able to recall or restore

the other. The association between names and things comprehends one of the most extensive applications of the power in question.

The circumstances under which one idea brings forward another into the view are principally these two—viz., first, previous *proximity*; and second, *likeness*. The terms "contiguity" and "similarity" are used in mental philosophy to express them. The first is exemplified in the examples of association given above; for in most of those it will be found that the conjoined notions have been frequently in the view at the same time, in consequence of which they have, as it were, grown together, or become part of the same whole. Thus, we have often noticed the darkened sky followed by a shower; the two facts have occupied the attention simultaneously, and, in virtue of some power belonging to our mental framework, they have cohered into an inseparable couple or aggregate in the mind. This is proximity, or contiguity. When one idea suggests another which was never in company with it before, it is generally through the force of some *likeness* between the two. I meet an old man in the street with a very peculiar face, which reminds me of the bust of Socrates. These two things had never accompanied one another in my mind before, and therefore it could not be the force of proximity that made the second to arise at the instigation of the first; but there was a certain amount of likeness or similarity between the old man's features and the features of Socrates, as represented to us in the bust; and it is a fact of our constitution, no less certain and no less important than the foregoing, that in cases where something now before the mind has a strong cast of resemblance to something formerly observed or conceived by us, but not at present thought of in any way, the present is apt to recall that past idea, whatever it may be. By the force of likeness, the traveler in new countries is constantly reminded of the scenes and objects familiar to him, and so is induced to draw comparisons between the one and the other. Identification and comparison both imply that things are brought together by virtue of their similarity, they not having been in company before. The principle of proximity operates most in memory, habit, and routine; similarity has to do with invention and originality, and is essential to the processes of reason and imagination.

*Law of Contiguity.*—The principle of association by proximity is not confined to ideas. We must state it in a more comprehensive form, in order to comprise the full sphere of its application; for our mechanical habits are formed through the very same power of our constitution that enables us to recall or remember ideas. The taught movements of a soldier or of a skilled workman are connected together so firmly that one succeeds to another almost of its own accord. Everything of the nature of acquisition supposes a plastic property in the human system, giving permanent coherence to acts that have been performed together.

The following is a general statement of the law under consideration:

*Actions, sensations, states of feeling, and ideas, occurring together, or in close succession, tend to grow together, or cohere in such a way that when any one of them is afterwards presented to the mind, the others are apt to arise.*

And first, as to association of actions, or voluntary movements. When we perform a train of movements without any further aid of the will than to commence the series, there must be a fixed connection between each and the one that follows, and this connection may be either instinctive or acquired. There are various cases of instinctive trains, such as the action of the heart, lungs, and intestines, and the movements of deglutition. When a morsel of food reaches the back part of the mouth, the muscles of the throat seize hold of it, and transmit it to the stomach, independent of our will. The connected movements in this case are provided for in the original structure of the nervous and muscular system. In walking, there is partly an instinctive tendency to alternate the limbs, and partly a confirming acquisition, the result of practice. But in those complicated operations that human beings are taught to execute in the various avocations of life, the associating principle is everything. The apparently simple and easy act of taking food is a complicated acquisition; in other words, an extensive group of associated movements. The seizing of the morsel is followed by the movement of the arm that carries it to the mouth; the mouth is opened simultaneously; after which follow the processes of biting and chewing; all which take place with the certainty of a machine, and without effort or attention directed to them. These associations were originally built up by slow degrees. "As a general rule, it takes many repetitions to cement so firm a union between successive and simultaneous movements as is implied in the above instance."

A good example of the association of movements is furnished in our requirement of spoken language, as in committing to memory words, sayings, and passages of books. When a child has perfectly acquired the Lord's prayer, the chain of association is so firmly knit, that the articulation of the words "Our Father" is followed irresistibly with those next succeeding, and so on to the end. The cohesion in this case is between the vocal movements corresponding to the enunciation of the words. Having gone many times through this one definite succession, the stream of nervous power, in some way that we cannot at present explain, acquires a tendency to fall into this one definite track, and in future to bring on the movements in the exact order that they have so frequently followed.

It is not merely actual movements that can be joined together in this way, but the

*ideas* of movement; for a man, meditating in language, and not speaking out his thoughts, can consolidate his trains so as to remember them afterwards.

When we proceed to sensations and the ideas, or subsequent traces, of sensations, and take along with these the variety of our movements with their ideas, we find an unlimited scope for the associating principle; and the consequences of its operation spread far and wide in the domains of our happiness, our knowledge, and our active capacity. It is only possible here to present a few illustrative examples.

In the various mechanical acquirements, which include the whole of special handicraft, industry, and skill, as well as the use of the bodily members in the more general actions of daily life, there may be traced the linkings of actions with actions, or actions with sensations and ideas. The helmsman steering a ship associates in his mind each deviation of the needle from the proper point with the specific muscular exertion to be applied to the wheel to rectify the ship's direction. The workman fabricating in wood, metal, or stone, acquires a firm connection between each aspect of the material and the muscular power to be applied to bring it one step nearer the desired form. The power of copying anything we see, as in writing, drawing, molding, etc., when completely mastered, is made up of associations between a visible appearance and the train of movements calculated to reproduce it. After practice, all this is done, as it is called, mechanically, or without those operations of considering, willing, and remembering directions, that are essential to the learner in a new art. The associations that grow up after a certain amount of practice, are in this case associations between movements and appearances to the eye, or sensations of sight. In the greater number of crafts, the eye is the guiding sense to the operator, but not in all. Sometimes the effect is vocal, as in performing music, and in making and tuning musical instruments, in speaking, etc. In other arts, the touch is the guiding sense, and in some, as in cookery, the taste and smell direct the operator. Each accomplished workman has in his mind many hundreds, not to say thousands, of couples or aggregates of definite movements with other movements and with sensations, contracted in the course of his apprenticeship to his calling.

If we inquire into the circumstances that favor and promote this extensive circle of acquisitions, we shall find several that may be named as of importance. In the first place, a *natural activity of temperament*, or an abundant flow of power to the active members, as shown in a great and various mobility of the frame, is a good basis of bodily acquirements. When the force of the system runs feebly towards the muscular framework, being perhaps expended in other ways, as in the thinking powers, more time is requisite to attain difficult mechanical arts. Another important circumstance is *the acuteness or delicacy of the sense* involved in the operation. A keen eye, sensitive to minute degrees of effect, is wanted in all the various occupations that turn on visible appearances; a good ear is indispensable to music and the arts of producing sounds; and so on. With a naturally dull sensibility to flavor, no man can easily become a good cook, or a taster of tea or wine. The third consideration is *the natural power of adhesive association* belonging to the individual character. Some minds have originally a more powerful adhesiveness than others, either for things generally, or for special departments. We see this when a number of boys come together at school, and in apprentices learning together. Some are always found taking the start of the rest in rapidity of acquirement; and although the reason may be found in some of the other circumstances now mentioned, yet observation shows that when everything else is allowed for, there remain natural differences in the rapidity with which the adhesive bond is cemented; some acquiring without effort what others take both time and labor to accomplish. The fourth principal circumstance is the *interest* taken in the work, or the degree to which it engages the feelings of the learner. This is a material consideration, accounting for the acquisitions made in matters that we have a strong taste for, without our having a pre-eminence in those other points that constitute natural capacity. These four conditions apply more or less to acquisition generally.

A detailed exemplification of this great principle of our nature might be given through all the departments of the human intellect. The acquirements of speech, as already said, contain a wide range of instances. The adhesion of language is partly in the vocal organs, partly in the ear, and partly in the eye, when we come to written and printed characters. The associations of names with things, with actions (as in obeying directions and command), and with other names (in acquiring foreign languages), are a gradual growth favored by such conditions as the above. The acquirements in science, fine art, and business, and in everything that constitutes skill or knowledge, proceed upon this plastic property of the mind. It also enlarges the sphere of our pleasures and pains. There are connections established in the mind between our states of feeling and the things that have often accompanied them, so that the accompaniment shall have power to revive the feeling. It is thus that we contract affections, both benevolent and malevolent, towards persons and things, our friends, our home, our country, our property, our pursuits.

This power of stirring up dependent associations to an extent that may be almost called unlimited (although there are limitations), is peculiar to the animal organization. Nothing parallel to it occurs in the mineral or vegetable world. It is a property of mind alone, and has its seat in the nervous tissue. We know that growth or change is

requisite to the progress of the adhesion; for it proceeds most rapidly in youth, health, and nutrition, and decays in old age, and during exhaustion and disease. And even to keep our acquisitions from fading away, it is requisite that they should be occasionally revived. A language acquired in early years may be utterly lost, by disuse. Sustained practice seems particularly necessary in early education; children's acquisitions are very liable to disintegrate, if not kept up and confirmed by new additions.

*Law of Similarity.*—This may be expressed as follows:

Present actions, sensations, thoughts, and emotions tend to revive their LIKE among previous impressions.

If the mind worked only by the principle of contiguity, nothing would ever occur to us except in some connection already formed. But some explanation is necessary as to the precise relationship subsisting between the two distinct forces of mental resuscitation, in order to show at once their distinctness and their connection. When the cohesive link between any two contiguous actions, sensations, or ideas is confirmed by a new occurrence or repetition, it is perfectly obvious that the present impression must revive the sum-total of the past impressions, or reinstate the whole mental condition left on the occasion immediately preceding. Thus, if I am disciplining myself in the act of drawing a round figure with my hand, any present effort must recall the state of the muscular and nervous action, or the precise bent acquired at the end of the previous effort, while that effort had to restore the condition at the end of the one preceding, and so on. But this reinstatement of a former condition by a present act of the same kind, is really and truly a case of the principle before us, or of like recalling like; and without such recall, the progressive adhesion of contiguous things would be impossible. It would appear, therefore, that similarity is tacitly assumed in the operation of contiguity, and is indispensable to the process by which our acquisitions are gradually built up. Why, then, do we set up the associating force of likeness as something independent and distinct? To answer this question we must advert to the fact that in those cases where the same impression is deepened by every new repetition, the old and the new are not merely similar, they are *identical*, and the resuscitation takes place without fail, and as a matter of course. But in going deeper into the explanation of the human intellect, we encounter many classes of similars, where there is not absolute identity, but the mixing up of a certain amount of *diversity* with the likeness actually existing. The botanist classing together all the plants of the same order, as, for example, the *rosaceae*, has to be struck with the occurrence of certain common characters—viz., the properties that distinguish the order—in the midst of great varieties in all other respects. It is important that he recognize these general marks, whether the plants be trees or shrubs, whether they be poisonous or wholesome, and under many other diversities. It is exceedingly important in science, in the business of life, and even in the creations of fine art, that the mind should take cognizance of likeness surrounded by unlikeness; which is the case that renders it necessary to characterize as distinct the associating force now under discussion. In the case of perfect identity between a present and a past impression, the past is recovered, and fused with the present, instantaneously and surely. So quick and certain is the process, that we lose sight of it altogether; we are scarcely made aware of the existence of an associating link of similarity under such circumstances. But when we pass from perfect to imperfect or partial identity, we are more readily led to perceive the existence of this link of attraction between similars, for we find that the restoration sometimes does not take place; cases occur where we fail to be struck with a similitude: the spark of resuscitation does not pass between the new impression and the old dormant one. Then it is that we recognize differences between different minds; one man tracing resemblance and making out identity better than another. Moreover, we can assign reasons connected with the culture of the individual, which partially explain superiority or inferiority in this important faculty; just as we have pointed out the conditions favorable to the rapid growth of the adhesive bond of proximity. The failure in reinstating an old impression by virtue of a present one like it, is solely ascribable to the want of perfect identity. When, in some new presentation of an object, the old familiar form is muffled, obscured, distorted, disguised, or in any way altered, it is just a chance if we recognize it; the amount of likeness still remaining will have a tendency to revive the object, while the points of difference or unlikeness will operate against the revival, and tend to restore things of their own kindred. If we hear a musical air that we are accustomed to, the new impression revives the old as a matter of course; but if the air is played with complex harmonies and accompaniments which are strange to us, it is possible that the effect of these additions may be to check our recognition of the melody; the unlike circumstances may repel the reinstatement of the old experience more strongly than the remaining likeness attracts it. If our hold of the essential character of the melody is but feeble, and if we are stunned and confounded by the new accompaniments, there is every probability that we shall not be put upon the old mental track made by the same air; in other words, we shall not identify the performance.

A few examples may next be given to show the workings of this associating power, and the consequences thence arising. The intellectual operations known under the names classification, generalization, induction, and deduction, all proceed upon the discovery of likeness among things lying wide asunder in space and time, and very often veiled by diversity. Thus, in order to include in one list all the species of the

*rose*, botanists have had to trace the characters of the genus through its various members, wherever they occur, and under the greatest differences in every other respect. It takes a keen identifying faculty—that is, a strong natural tendency for the resurrection of like to meet like—to see the resemblance of some of these species to the rest; and it has happened in many departments of knowledge that a class has remained incomplete for a time, purely from the disguised character of some of the individuals. So in the process termed *induction*, by which a general law is arrived at by comparing instances of it everywhere, there must be an attraction of similars, in order to bring together in the mind the collection of particulars that the induction is based upon. Thus, Newton assembled in his view the various transparent bodies that he had found in the course of his experiments to refract or bend light strongly, his only intellectual instrument for doing so being the bond of likeness operating as a power of recall. Having looked at them in company, he saw that some were remarkable for their weight or specific gravity, and others for containing inflammable ingredients; upon which he raised the general induction, connecting these two properties with high refrangibility. Then, *deductively*, he applied this generalization to the diamond, which refracts light more than any other known substance; and as it is not a heavy material, he extended the other inference to it—namely, that it was made up of some inflammable material, an inference afterwards confirmed by the discovery that it is crystallized carbon. Many of the greatest discoveries in science have turned on the identification of modes of action never before supposed the same, as when Franklin was struck with the resemblance between the atmospheric thunder and lightning and the phenomena of common electricity.

Another wide field for the operation of the same principle is the region of *illustrative comparisons*, whereby two things widely remote are brought together, in the view either to elucidate one another, or for the sake of ornament and poetic effect. Most men of genius in literature and poetry have contributed original illustrations, similes, metaphors, or comparisons in the course of their compositions. Shakespeare carries the palm in this faculty. The writings of Bacon are remarkably rich in those that serve the purpose of exposition. Science is with him the “interpretation” of nature: final causes are “vestal virgins;” they have no fruit; fallacies are “idols.” Edmund Burke, another master of illustrative comparison, has termed revolutions the “medicine” of the state, and regular government its “food.”

If we inquire into the circumstances that render one mind more prolific in new identifications and comparisons than another, apart from difference of original capacity, we must refer mainly to the fact that the one has had the greater previous familiarity with the class of things thus brought up by the attraction of similarity. A mathematician is the most likely person to bring up comparisons from mathematics; a botanist is prepared to identify plants; a traveled man provides illustrations from foreign countries; a historian, from history. The sailor is notoriously rich in nautical similes and illustrations. When any one not specially versed in a subject is yet prone to draw upon it profusely in the way of comparison, we must then refer to great natural endowment as the sole explanation. But our space does not allow us to dwell further on the subject. (For the full exemplification of both the associating principles and of the complications that they give birth to, see Bain on *The Senses and the Intellect*).

The earliest known attempt to lay down the laws whereby thought succeeds to thought, is that contained in Aristotle's treatise on memory. He enumerates three different principles of mental resuscitation—viz., similarity, contrariety, and co-adjacency. He has been followed by most other philosophers as regards all the three principles. It is now, however, clearly seen and generally admitted that contrariety is not an independent associating force. When a thing suggests its opposite or contrary, it will be found that the two have been previously together in the mind, and have therefore acquired a mutual hold by contiguity. Such, for example, is black and white, wet and dry, health and sickness, prosperity and adversity, etc. Contraries, in fact, have a natural inseparability; they are of the class of relatives like father and son, which imply each other necessarily, and have no meaning except by mutual reference. It requires no new principle of our constitution to account for suggestion in this particular case. Moreover, when things are strongly contrasted with one another, as high position before a fall, the mind is greatly impressed with the shock of transition, and so retains a lively recollection of the sequence, having by that means a greater tendency to pass from the one to the other. Thus, then, the enumeration of Aristotle is reduced to the two principles that we have now expounded.

Hobbes recognized the principle of contiguity as the foundation of reminiscence; but the Aristotelian philosopher, Vives, who wrote in the 14th c., was the first to specify in minute detail the various circumstances that determine the adhesive bond of recollection. Hume's enumeration is well known to have comprised the three principles of resemblance, contiguity, and causation, which he illustrates as follows: “A picture naturally leads our thoughts to the original [resemblance]. The mention of one apartment in a building naturally introduces an inquiry or discourse concerning the others [contiguity]. And if we think of a wound, we can scarce forbear reflecting on the pain which follows it [causation].” Causation, however, is merely a case of contiguity; so also we may say of order in place, and order in time, which have been given as distinct principles.

An attempt has been made to generalize similarity into contiguity, but without

success. For a full and critical view of the history of these laws, see Sir W. Hamilton's edition of Reid.

**ASSOUAN**, **ESSUAN**, or **ESWAM**, the ancient Syene, a t. of upper Egypt, on the e. bank of the Nile, near the borders of Nubia, 110 m. s. of Thebes, in lat.  $24^{\circ} 5' 30''$  n., and long.  $32^{\circ} 55'$  e. There are few remains existing of the ancient city. Some granite columns present themselves among the ruins, but do not seem of an early date; and part of a temple still remains with a dilapidated portico. Of the town-wall, that part which lies to the s. of the old t. is still standing; and beyond it is the cemetery of A., where there are numerous tombs, mostly cenotaphs, with Arabic inscriptions. In the neighborhood there are several granite quarries, some of them remarkable for remains of ancient materials that had been cut from the rock, and partially hewn, and for antique inscriptions and tablets, announcing the removal of blocks and the reign of the Egyptian monarch by whose orders they had been quarried. The environs of A. are sterile and sandy; but the palm thrives, and the dates, which are excellent, form the staple of the trade. Some traffic is carried on in senna, henna, charcoal, wicker-baskets, and slaves.

The ancient name Syene is the Coptic word *soun* or *suon*, signifying "opening;" and the modern one is formed by adding the Arabic *el*, "the," softened into *es*, viz., *Es-suon*, "the opening." A. and its vicinity are highly interesting to geologists and mineralogists: that kind of granite called syenite receives its name from the town.

**ASSOUCY**, **CHARLES COYPEAU D'**, 1604-79; a French poet, who called himself "the emperor of burlesque," a title which others changed to "Scarron's ape." He was the author of many burlesque works, none of them especially brilliant.

**ASSUMPSIT**, in law, a comprehensive title for a wide class of actions. *Express A.* is an undertaking made orally or by writing not under seal, or as matter of record, to perform an act or to pay money. *Implied A.* is an undertaking presumed in law to have been made by a party, from his conduct, although he has made no express promise; on the ground that everybody is supposed to have undertaken to do what, in point of law, is just and right. In practice, A. is a form of action for the recovery of damages, for non-performance of a parole, or simple, contract. A. may be distinguished also as *special* or *common*. *Special A.* includes action on written agreements, or for dereliction where a contract exists or may fairly be implied, such as professional neglect on the part of a physician, or by common carriers. *Common A.* is usually an action for satisfaction for goods sold or money lent. *Non-A.* is the usual plea under which the defendant may give in evidence most matters of defense.

**ASSUMPTION**, a village and river of Lower Canada. About 8 m. below the village, the river flows into the St. Lawrence, or rather into the Ottawa, nearly opposite to the lower extremity of the island of Montreal.—A., or Asuncion, is also the name of the capital of Paraguay, on the left bank of the river of that name. It has a pop. of 40,000, and has a trade in hides, tobacco, timber, wax, and Paraguay tea. The city was founded in 1535 by the Spanish, and soon became a place of importance, though not of beauty, being ill-built, dirty, and disagreeable. The surrounding country is rich in pastures, and also produces crops of wheat, maize, sugar, tobacco, honey, wax, etc.

**ASSUMPTION**, a parish of s.e. Louisiana, w. of the Mississippi; 320 sq. m.; pop. 70, 13,244—6984 colored. It is one of the best sugar districts in the country, the soil being remarkably fertile. The principal town is of the same name.

**ASSUMPTION OF THE VIRGIN MARY**. A festival of the Romish church. In the 7th c., the idea originated that the soul and body of the Virgin had been carried up to heaven by Christ and his angels. The Roman Catholic church, therefore, has, ever since that period, kept the 15th of Aug. in memory of Mary's translation into glory; although, from the 4th c. until then, it had kept the same day in memory of her death. Liguori, in his *Glory of Mary*, gives a very minute account of the circumstances of her assumption.

**ASSURANCE**. See **INSURANCE**.

**ASSURANCE**, **COMMON**, is described by Blackstone as the legal evidence of the translation of property, whereby every man's estate is assured to him, and all controversies, doubts, and difficulties are either prevented or removed. For an account of these common assurances or *conveyances*, as they are generally termed, see **DEED** and **CONVEYANCE**.

**ASSYNT**, a mountainous, moorish, and very rugged district or parish, 25 m. long and 15 broad, in s.w. Sutherlandshire. It mostly consists of a network of rocky heights, interspersed with a multitude (200) of dark, motionless tarns or pools, of various sizes, with some larger lochs, the largest, loch Assynt, being 10 m. long and 1 broad. The district consists of gneiss, silurian rocks, and primitive limestone. There are a dozen mountains 3000 to 3500 ft. high. Some of the mountains are covered with white bleached stones and protruding rocks like patches of snow. The mountains have frequently the form of artificial pillars and cairns, and are the remains of an enormous denudation of the nearly horizontal strata of the district. Suil Veinn is a perfect sugar-loaf, towering nearly 2000 ft. above a rugged table-land of gneiss hills, 800 to 1000 ft. above the sea. In Ardvreck castle, on a promontory on the east side of loch A., the famous marquis of Montrose was confined in 1650.

**ASSYRIA** (called Athura on Persian cuneiform inscriptions, and Assura on the Median) was the northernmost of the three great countries that occupied the Mesopotamian plain. It was bounded on the n. by the Niphates mountains of Armenia; on the s., by Susiana and Babylonia; on the e., by Media; and on the w., according to some, by the Tigris, but more correctly by the water-shed of the Euphrates, for many Assyrian ruins are found to the w. of the Tigris. It was thus about 280 m. long from n. to s., and rather more than 150 broad from e. to w. This plain is diversified by mountain-chains on the n. and e., and watered by the Tigris and its affluents, between two of which—the Zab rivers—lay the finest part of the country, called Adiabene. As it was the boundary-land between the Semitic people and Iran, it became the scene of important political events. Its extraordinary fertility enabled it to support a large population. The high degree of prosperity and civilization reached by its inhabitants in very early times is attested not only by ancient writers, but by the extensive ruins of mighty cities, by the canals and contrivances for irrigation, and by the many proofs—furnished by recent excavations—of an acquaintance with the arts and sciences. The ruins of many cities are grouped around Nineveh; while lower down, the Tigris exhibits an almost unbroken line of ruins from Tekrit to Bagdad. Under the Moham-medans, this fine country is now almost a desert.

*History.*—Ancient authorities differ widely from each other respecting the rise and progress, the extent and the duration, of the Assyrian empire. Ctesias, a Greek of Cnidus, court-physician to Artaxerxes Mnemon, is quoted by various ancient writers; and his information, though utterly incredible and fabulous, has been followed by most classical historians, and by the whole series of ecclesiastical writers. Many ingenious but futile attempts have been made to reconcile his history with the Scripture narrative. Berosus, a priest of Bel at Babylon, who wrote about 268 B.C., and Herodotus, differ widely from Ctesias, but are confirmed in many important particulars by the Bible, and by the continually increasing evidence derived from cuneiform inscriptions.

In the Bible narrative, we are told that Nineveh was founded by Asshur from Babylon (Gen. x. 11). The latter city, therefore, must have been the capital of a more ancient empire, as Berosus asserts, and recent discoveries go far to prove, though Greek writers maintain the reverse. The next notice we have of A. does not occur till 710 B.C., when Pul, king of A., invaded Palestine, but was bought off by Menahem, king of Israel. Tiglath-pileser, who succeeded Pul (738 B.C.), conquered Syria, and carried off many of the Jews into captivity. Next, Salmanezer (750 B.C.) subdued Israel, which, at the instigation of the Egyptians, had refused to pay tribute. The next is Sennacherib (713 B.C.), who attacked Egypt, and threatened Judah under Hezekiah. He was slain by his two sons, and succeeded by his son Esarhaddon, who was also master of Babylon (2 Chron. xxxiii. 11), which, under Nabonassar, had been independent of Nineveh since 747 B.C. Very little credit is to be attached to the expedition of Holofernes recorded in the book of Judith.

After this, the empire appears to have gradually decayed, until at last, in the reign of Sardanapalus II., or Saracus, a league was formed for its destruction between Nabopolassar, governor of Babylon, and Cyaxares, king of Media, which was strengthened by the marriage of Nebuchadnezzar, son of the former, to Nitocris, daughter of the latter. The war and siege are said to have been interrupted by an invasion of the Scythians, which drew off Cyaxares; but at length Nineveh was taken and destroyed about 606 B.C., or, according to Rawlinson, 625. In the time of Darius Hystaspes, A. rebelled without success in conjunction with Media. In the time of Herodotus, the capital had ceased to exist; and when Xenophon passed it, the very name was forgot, though he testifies to the extent of the deserted city, and asserts the height of the ruined walls to be 150 ft. An inconsiderable town seems to have existed on its ruins in the reign of Claudius; and the last notice we have of Nineveh in the classics is in Tacitus.

According to the Greek legends, the Assyrian empire was founded by Ninus. To this monarch and his consort Semiramis are ascribed expeditions on an incredibly magnificent scale against Bactria, Ethiopia, and India. We are told that Semiramis led an army of 3,000,000 infantry, 500,000 cavalry, and 100,000 chariots, and a fleet of 2000 ships, and was encountered by forces more numerous still, and defeated; that she returned to Nineveh, where she soon afterwards died, and was reckoned among the gods, and was succeeded by her son, Ninyas, an effeminate prince. The succeeding part of the history as related by Ctesias is equally false, though that writer managed to make the ancient world give credit to his narrative in preference to that of Herodotus. He gives a list of monarchs from Ninus to Sardanapalus, which is now considered to be a clumsy forgery. According to him, for 30 generations after Ninyas, the kings led a life of luxury and indolence in their palace; the last of them, Sardanapalus, made a vigorous defense against Arbaces, the rebel governor of Media, but finding it impossible to defend Nineveh, he set fire to his palace, and burnt himself with all his treasures; this event took place 1206 years after Ninus. Now, the above account represents Nineveh to have perished nearly three centuries before the real date, which was about 605 B.C., and is utterly incompatible with Scripture. Herodotus assigns to the empire a duration of 520 years, and Berosus of 526 years. In order to reconcile these conflicting accounts, historians have supposed that Nineveh was twice destroyed, but this supposition is now generally rejected. However, that Nineveh was actually destroyed by fire is proved from the

condition of the slabs and statues found in its ruins, which show the action of intense heat.

A. became a Median province, 605 B.C., and afterwards, in conjunction with Babylonia, formed one of the satrapies of the Persian empire. In 331 B.C., at Gaugamela, near Arbela, in A., Alexander defeated Darius Codomannus. In 312 B.C., A. became part of the kingdom of the Seleucidae, whose capital was Seleucia, on the Tigris. It was afterwards subject to the Parthian kings, whose capital was Ctesiphon, and was more than once temporarily in possession of the Romans. When the Persian monarchy of the Sassanides was destroyed by the successors of Mohammed, A. was subject to the caliphs. Their seat was Bagdad from 762 A.D. till 1258. It has been under the Turks from 1638, at which period it was wrested from the Persians.

We shall now proceed to mention a few historical points that have been satisfactorily ascertained from the cuneiform inscriptions. For these we are indebted to Rawlinson's *Herodotus*.

It has not been ascertained when A. first became independent of Babylon (q.v.). The seat of government was first at Asshur (now *Kileh-Shergat*), on the right bank of the Tigris, 60 m. s. of the later capital, Nineveh. At this place have been found the bricks and fragments of vases bearing the names of the earliest known Assyrian kings, for Ninus and Semiramis are to be considered as mere inventions of Greek writers. The earliest known king is *Bel-lush*, one of a series of four. These reigns probably occupy from 1273 to 1200 B.C. Of the next series of six, the names of five are recorded on the famous Kileh-Shergat cylinder, the earliest purely historical document as yet discovered in Mesopotamia.

Tiglath-nin, the last of the Kileh-Shergat series, was succeeded by his son, Asshur-dani-pal, the warlike Sardanapalus I. of the Greeks. He made Calah, the modern *Nimrud*, his capital, lying 40 m. further n., on the left bank of the Tigris. His annals are very complete. Among other conquests, he mentions that he had taken tribute from Tyre, Sidon, and other Phœnician cities. He was the founder of the n.w. palace at Nimrud, which, next to that of Sennacherib at Koyunjik, is the largest and most magnificent of all the Assyrian edifices. The greater portion of the sculptures now in the British museum is from this building.

Sardanapalus I. was succeeded by his son Shalmanubar, whose deeds are briefly recorded on the black obelisk now in the British museum, the full account being apparently reserved for the colossal bulls, which seem to have been the usual dedication after a victory. Of his campaigns, the most interesting to us are those in which he defeated Benhadad of Damascus, and his murderer and successor Hazael. According to his own account, Shalmanubar defeated Hazael, killing 16,000 of his fighting-men, and capturing more than 1100 chariots (884 B.C.). The obelisk also records the tribute paid by *Yahua, son of Khumri*, i.e., Jehu, son of Omri, king of Israel. Now Jehu was son of Jehoshaphat, and had done his utmost to extirpate the family of Omri; but probably Jehu, like other usurpers, was anxious to identify himself with the family which he had dispossessed, and of course the Assyrians accepted the title he gave himself.

*Iva-lush*, probably the Pul of the Scriptures, is recorded on a pavement-slab from Nimrud to have received tribute from Samaria, Tyre, Damascus, Idumæa, and Palestine, which assertion agrees with the account given (2 Kings xv.) of the 1000 talents paid by Menahem. With this king ends the first dynasty, in which we have 18 monarchs from Bel-lush to Iva-lush (1273-747 B.C.).

The later Assyrian empire begins with Tiglath-pileser II. (747 B.C.), and ends with the destruction of Nineveh (625 B.C.). It is plain from Scripture that the empire was in a flourishing condition during the reigns of those kings who came in contact with the Hebrews, and this account exactly accords with the monuments, but contradicts Herodotus. Probably, on the accession of Tiglath-pileser II., Babylon had revolted, and this partial rebellion had reached Herodotus in an exaggerated form. The annals of this prince exist only in a very fragmentary state. The name of his successor, Shalmaneser, has not yet been found on the monuments. The capture of Samaria is usually ascribed to this prince, but his successor, Sargon, expressly asserts that Samaria was taken by himself in his first year. Sargon's palace at *Khorsabad*, near Nineveh, furnished the valuable series of monuments now in the Louvre. Sargon was succeeded by his son Sennacherib. He fixed the seat of government at Nineveh, and employed the forced labor of 360,000 men to repair the great palace. Later in his reign, he built a new and more magnificent edifice, which he decorated with sculptures representing his various exploits. This is the palace excavated by Layard. It contained at least three spacious halls—one of them 150 ft. by 125, and two long galleries, one of 200, the other of 185 ft., besides innumerable chambers. The excavated portion covers above 8 acres. The annals of Sennacherib extend only to his eighth year. He relates at length his successful attack upon Babylon, his invasion of Judæa, the submission of Hezekiah, and his deportation of 200,000 Jews. This expedition is not to be confounded with the second invasion, in which he failed ignominiously, and which is not recorded on his monuments. His assassination very shortly after his return to Nineveh, after his second expedition, readily accounts for this silence.

Esarhaddon, his son and successor, held his court sometimes at Nineveh, sometimes at Babylon. Bricks bearing his name have been discovered at *Hillah*, and a tablet at Babylon dated in his reign. This explains how Manasseh was brought to him at Babylon, when he was led captive from Jerusalem (2 Chron. xxxiii.). No record has as yet been discovered of this expedition against Palestine. His edifices are not inferior to those of his predecessors. He employed Greek and Phœnician artists, and to them, probably, we owe the beautiful bas-reliefs that adorn the edifices of his erection. The decline of the empire probably commenced with Asshur-bani-pal II. The arts of peace flourished, while the military vigor of the nation declined. The sculptures of this reign are decidedly superior to the earlier in spirit, delicacy, and freedom from conventionality. The slabs show that hunting, not war, was this king's favorite pursuit. He was succeeded by his son Asshur-emit-ili, the last king of whom any records have yet been discovered. It is uncertain whether Nineveh was destroyed under him, or under a successor, the Saracus of Berosus, the effeminate Sardanapalus of the Greeks. The character usually given of this last king, as a debauchee throwing off his indolent habits, and after performing prodigies of valor, perishing by a glorious death, rather than surrender, is derived solely from Ctesias. All we distinctly know is that, finding himself betrayed to the Median king by Nabopolassar, governor of Babylon, he set fire to his palace and perished in the flames.

We may here note a singularly important cuneiform discovery made by Mr. George Smith, of the British museum, and the substance of which was made public at a meeting of the Biblical archaeological society in Dec., 1872. While engaged on an examination of the collection of Assyrian tablets in the British museum, Mr. Smith lighted upon a curious series of legends, including a copy of the story of the flood. On discovering these documents, which were much mutilated, he searched over all the collections of fragments of inscriptions, consisting of several thousands of smaller pieces, and ultimately recovered 80 fragments of these legends. The tablets were originally at least 12 in number, forming one story or set of legends, the account of the flood being on the 11th tablet. Of the inscription describing the flood, there are fragments of three copies, containing duplicate texts. These texts belong to the time of Asshur-bani-pal (*circa* 660 B.C.), and were found in the library of that monarch in the palace of Nineveh. The original text, according to the statements on the tablets, belonged to the city of Erech, and appears to have been either written in or translated into the Semitic Babylonian at a very early period. Mr. Smith is of opinion that its composition cannot be placed later than the 17th c. B.C., while it may be much older. The Assyrian story of the deluge is both like and unlike the Scripture narrative. The flood is sent as a punishment for sin; the builder of the ark is called Sisit (the *Xisuthrus* of the Græco-Chaldean Berosus); he gathers into the vessel all his male and female servants, all the sons of the army, and all the beasts of the field; the storm of rain lasts only six days, and yet submerges the whole earth; all life is destroyed; Sisit sends forth a dove which can find no resting-place, and returns; then a swallow, which is also forced to return; then a raven, which does not come back. The ark rests on a mountain, the animals are liberated, an altar is built by the grateful patriarch, and Bel, the great god, makes a "covenant" with Sisit. The minutest details of this Assyrian legend diverge greatly from the Hebrew account, and lead to the conclusion that in each we have an independent tradition of some great natural catastrophe in the early ages of human history. Mr. Smith notices that the Biblical narrative is the version of an inland people; the name of the ark in Genesis means a chest or box, and not a ship; there is no notice of the sea or of launching, no pilots are spoken of, no navigation is mentioned. The inscription, on the other hand, belongs to a maritime people; the ark is called a ship, the ship is launched into the sea, trial is made of it, and it is given in charge to a pilot. This seems to point to the Persian gulf as the birthplace of the old legend. Mr. Smith returned in 1874 from Chaldæa, and gave an account of his valuable discoveries in a work entitled *Assyrian Discoveries* (1875). Believing that many more legends and histories lay beneath the ruins of the ancient cities of Chaldæa, he was on his way to prosecute his third exploration, when he succumbed to the hardships and privations of the task, and died at Aleppo in August, 1876.

*Government.*—The government was despotic, as suited the character of the people. The empire was a mere congeries of kingdoms bound to the supreme authority only by certain obligations of paying tribute, giving presents, and showing due respect. Each kingdom retained its own rulers, laws, and religion, although we do find some attempts to rule by satraps and collectors of tribute. Tiglath-pileser also boasts, in an inscription, of having punished and crucified the Chaldeans who refused to worship his gods. In consequence of this imperfect organization, the empire was exposed to frequent revolts of the subject nations, when such opportunities offered as a disputed succession, or want of energy in the ruling prince. Then the labor of conquest had to begin anew, and it was sought to diminish the danger of the central power by inflicting severe punishments on the rebels. The history of the Jews has made us familiar with one of these devices—viz., the wholesale deportation of the inhabitants of the offending district. It may be readily believed that such an empire, though imposing from the magnificence and wealth of the capital, yet, from the impoverishment and weakness of the subject states, was continually liable to fall to pieces, and was ill fitted to resist an attack from

without. That A. did actually last for five centuries, was owing to a long succession of warlike princes, and to the energy of the population.

*Religion.*—The religion of the Assyrians was nearly identical with that of the Babylonians. It was a gross polytheism, their gods being thousands in number, and each village having its own particular deity. From thousands of theological tablets now in the British museum, it is known that each divinity had many names, and some of them as many as fifty titles besides. Again, many deities that are prominent in the Babylonian pantheon are either unknown or occupy a subordinate position in the Assyrian. Besides, the same gods did not remain equally popular throughout. The supreme god was Asshur, probably the deified patriarch. His worship was confined to Assyria. He is generally associated in the inscriptions with *Nin* and *Nergal* (2 Kings xvii. 30), who are represented by the man-bull and the man-lion. The winged globe, so often seen in the sculptures, from which a figure with a horned helmet shoots his arrows, is supposed to be the emblem of Asshur. Next in rank is the governing triad, answering to the Pluto, Jupiter, and Neptune of the classical mythology; the next group corresponds to Æther, the sun and the moon; then five inferior deities, representing the five planets. Each god is associated with a goddess. Mylitta, or Beltis, is the "queen." The male and female powers of the sun are represented in the Scripture phrase, "Adrammelech and Anamelech, gods of Sepharvaim"—that is, of Sippara, a town a few miles above Babylon. *Bel-merodach* was originally an inferior deity, son of Hēa, the fish-god; but, under the later Babylonians, we find him monopolizing the greater part of the homage which used previously to be divided among several. Nisroch (2 Kings xix. 37) has not been yet ascertained. Nebo (Isaiah xlv.) is one of the five planetary gods, and corresponds to Mercury. The systems of notation, divisions of time, the planets and stars, animals and metals, divination and astrology, were all more or less closely connected with theology.

*Ethnology.*—The Assyrians have been assigned by some ethnologists to the Aryan race, but it is now generally acknowledged that they were a branch of the Semitic family of nations, and therefore were members of the same grand division of the human race as the Syrians, the Phœnicians with their colonies, the Jews, and the modern Arabians. In the 20th c. B.C., Semitism, as a distinct ethnic element, appears to have first developed itself. The original races, variously called Scythic, Turanian, or Tartar, appear to have once been spread over the whole space from the Caucasus to the Indian ocean, and from the Mediterranean to the mouths of the Ganges. Their type of language has continued to our time to exist in four fifths of Asia, and in some of the remotest corners of Europe, as among the Finns, Lapps, Turks, and Hungarians. In Mesopotamia, and in the valley of the Nile, where natural advantages induced men early to form settled communities, the rude and inartificial type of language was developed into Hamitism, and afterwards still further improved into Semitism. Then seems to have commenced a series of migrations. Asshur went forth probably at this time from Babylon to A., Abraham and his followers to Palestine, the Joktanian Arabs to Arabia. From these seats, Semitism was afterwards carried to Cyprus, to the southern seaboard countries of Asia Minor, to Carthage, Sicily, Spain, and western Africa.

The traditions of A. indicate a very early connection between Ethiopia, Arabia, and the cities on the Euphrates. Mesopotamia undoubtedly contained a large proportion of Arabians, and this accounts for the fact that Herodotus styles Sennacherib king of the Arabians and Assyrians. The Chaldeans, colonies of whom were planted in Armenia by the Assyrian kings, are supposed by some to have been a foreign tribe, which had emigrated from the north, and become a priestly caste. But the *Akkad* race, of which the Chaldean is a tribe, is with more probability thought to have inhabited Babylonia from the remotest times, and by it the earliest civilization in Mesopotamia was originated. Probably the art of picture-writing was possessed by the Hamitic tribes who lived in the valley of the Nile, and passed eastward to the Euphrates. The *Akkad* language appears to have been formed before Semitism attained its peculiar development and organization. Long after Semitism had become predominant in Mesopotamia, the *Akkad* or Chaldean alphabet continued to be the scientific language in which all the tablets relating to mythology, astronomy, or science, as well as most historical and official records, were written. This alphabet was adopted with certain modifications by the Semitic tribes, which became predominant in Assyria. The cuneiform characters were elaborated from forms of natural objects, and gradually became phonetic from being symbolic, and for convenience of engraving, assumed the form of arrow-heads, instead of the rounded and flowing forms which are introduced by the use of plastic materials. After the Aryan race had spread more extensively in western Asia, the Persian monarchs, when they wished to make any communication to their subjects generally intelligible, found it necessary to publish it in three languages belonging to the principal divisions of human speech; hence the trilingual inscriptions of Behistun, etc., which consist of an Indo-European, a Tartar, and a Semitic column. It is still necessary in many places to employ three tongues, representatives of the three families, Persian, Turkish, and Arabic.—See Lenoirant, *La Langue Primitive de la Chaldée*.

*Antiquities, Civilization, etc.*—The excavations carried on by M. Botta, French consul at Mosul, and by Layard near Mosul, Khorsabad, and Koyunjik, have led, as we have partly seen, to very interesting discoveries. The palaces and buildings that have been

laid open are full of sculptures, all covered with inscriptions, in deciphering which considerable progress has been made, and more may be expected. Among the most remarkable monuments now in the British museum are two winged, human-headed lions, 12 ft. high, and as many in length; winged human-headed bulls of similar dimensions with the lions; winged sphinxes; and the famous obelisk of black marble, sculptured on the four sides. On this last are represented a victory, a prisoner prostrate at the feet of the king, and foreign people offering tribute, and leading such animals as the Bactrian camel, elephant, lion, and rhinoceros—animals found only in lands far east of the Tigris. The bas-reliefs are very numerous, exhibiting especially war and hunting. The march, the onset, the pursuit, the siege, the passage of rivers, the submission and treatment of captives, secretaries noting the number of heads taken in battle, and the amount of spoil; the chase of the lion, of the antelope, of the wild ass, and other animals—such are the favorite subjects of the Assyrian sculptor. Nor are they treated in the conventional style of Egypt, but in a manner which, for grace, spirit, correctness, and delicacy of execution, excels everything else known in Asiatic art. The artists sometimes follow modes of representation different from ours; for instance, a bull has five legs given him, in order that from all points of view he may be seen with four; a ladder stands edgewise against a wall, to show it is not a pole. But a truthful impression is always aimed at, and it is this that gives these sculptures their value. The labor bestowed on the careful finish of a priest's dress, and in the tasteful decoration of an article of furniture, proves them to be the work of an ingenious and painstaking people. From the bas-reliefs we gain but little information respecting the private life of the Assyrians. There are a few which represent the foddering of cattle, women riding on mules, etc.

It is natural to expect that Nineveh—a wealthy and luxurious city—imported many of the products of other countries, yet the manufactured goods would mainly be of home production. The jars, bronzes, glass bottles, carved ornaments in ivory and mother-of-pearl, engraved gems, bells, earrings, arms, utensils, are of excellent workmanship. The ornaments especially are in good taste, and evince no inconsiderable skill in the working of metals. Transparent glass was not unknown, nor the use of the lens as a magnifying agent. The Assyrians knew the principle of the arch, the use of the lever and roller, and the construction of aqueducts and drains. In the arts of peace, they appear to have been not inferior to any ancient nation; while their conquests, and the long duration of their empire, suffice to prove their capacity for war.—See Rawlinson's *Five Great Monarchies of the Ancient World, Chaldaea, Assyria, Babylonia, Media, and Persia*; and Mr. George Smith's paper read at a meeting of the Biblical archaeological society, 1872, and the article *Babylonia*, in the *Ency. Brit.*, 9th ed.

AST, GEORGE ANTON FRIEDRICH, 1776-1841; a German philologist. He was professor of classical literature at Landshut, and at Munich in 1826. Among his works are a *Manual of Aesthetics, Life and Writings of Plato*, and an edition of Plato with commentary.

ASTACUS. See CRAYFISH and LOBSTERS.

ASTARTE (styled Ashtaroth in the Old Testament), the name of the chief female deity of the Phœnicians, Carthaginians, and Syrians (Syria Dea), also worshiped by the Jews in times when idolatry prevailed. A. was the original from which the Greeks borrowed their Aphrodite (q.v.). As Baal was god of the sun, A. was goddess of the moon. Her chief temples were in Tyre and Sidon. According to ancient accounts, her worship was of a licentious character. The oldest known image of her—that in Paphos—represented her simply under the form of a white conical stone. In Canaan and Phœnicia she was subsequently typified under the form of a cow, or sometimes she had only a cow's or bull's head; still later, her emblem became a star; and finally, she was conceived of as the "queen of heaven," sitting on a lion, her head surrounded with rays, and in the one hand a thunderbolt, in the other a scepter.

ASTARTE, a genus of mollusca, with bivalve shells, the type of a family *astartidæ*, very closely allied to the *veneridæ* or Venus family. It is interesting chiefly with reference to geologic changes and the history of life and organization, because only a few species seem now to exist, and these limited to the north Atlantic and Arctic oceans, whereas the fossil species are extremely numerous, commencing with the *lias* period, and distributed over the whole world. The *astartidæ* may be regarded as having given place to the *veneridæ*, which commenced with the *oolitic* period, and are among the most abundant bivalve mollusca of the present time.

ASTATIC NEEDLE, a magnetic needle for which the influence of the earth's magnetism has been evaded or neutralized. A needle would become A. if it were placed with its axis vertical at the magnetic pole, and it would point indifferently to any part of the horizon. A needle is usually made A. by fastening below it to the same axis a second needle of equal directive force, having its poles reversed. The influence of the earth's magnetism on the two needles, being equal and opposite, is neutralized, and the pair is then free to respond to any other magnetic influence which may be presented to it. The A. N. is an important part of most galvanometers.

A-STAY, the position of an anchor when, during heaving, the cable forms an angle with the surface of the water in line with the stays of the ship.

**ASTER** (Gr. a star, from the form of the flowers), a genus of plants of the natural order *compositae*, which Lindley has therefore chosen to call *asteraceae*. The ray and the disk are of different colors. The genus contains a great number of species, both herbaceous and shrubby, which have been arranged into six or seven groups, regarded by many as distinct genera. One species only, *A. tripolium* or *tripolium vulgare*, the sea starwort, is a native of Britain. It is common in salt marshes. A number of perennial species are in cultivation as garden-flowers, of which the New England A. (*A. nova angliae*) and the Michaelmas daisy (*A. tridacnoides*), both natives of North America, are perhaps the most common, and, with some of the other species, are prized as among the comparatively few flowers to be seen at that dull season when autumn is giving place to winter. But the best known and most valued of all the asters is the China A. (*A. chinensis*), a summer annual, of which many varieties are in cultivation, and new ones are continually introduced. It was brought from China in the earlier part of the 18th century. The varieties exhibit great diversities of form and color. The plant delights in a rich free soil. In the northern parts of Britain, the seed is generally sown in April in a hot-bed, or in pots under a frame, and the young asters are planted out in the open air in May. They flower from July to the end of autumn, and contribute much to the liveliness of the flower-garden.—*A. argophyllus*, or *haertia argophylla*, is a shrub, a native of Van Diemen's land, smelling strongly of musk. The whole plant has a whitish aspect. It grows to a considerable size, but succeeds in the open air only in the very south of England.

**ASTER, ERNEST LUDWIG VON, 1778-1855**; an engineer; a lieutenant in the army of Saxony in 1800, and captain in 1809. Napoleon took an interest in his plan for the fortification of Torgau and adopted it, employing A. to superintend the work. A. soon after went into the service of Russia, took the command of a Cossack force, and fought at Bautzen and Leipsic. Returning to Saxon service in 1813, he became a colonel; two years later, in the Prussian engineer corps, he was engaged at Ligny and Waterloo. After the last battle he was promoted to be general, and made inspector of Prussian fortifications, winning a world-wide reputation in the construction of the defenses of Coblenz and Ehrenbreitstein. He was made commander of both fortresses; in 1827, lieutenant-general; in 1842, general of infantry. Ten years afterwards he was made a councillor of state. He left essays and other works posthumously published.

**ASTERABAD**. See **ASTRABAD**.

**ASTERIAS AND ASTERIAE**. See **STARFISH**.

**ASTERISK** (Gr. a little star), a sign or symbol (\*), used in writing and printing either as a reference to a note at the bottom or on the margin of the page. The obelisk (q.v.), or dagger (†), and many other marks, are similarly employed; but when there are several references on the same page, it is now common to use the numerals 1, 2, 3, etc. The A. and other similar signs may have any arbitrary meaning assigned to them, at the will of the writer, an explanation being previously given what the signification is to be. The Greek grammarians, or critics, used the A. to mark a passage that had been unjustly suspected, but was to be held as genuine, or a passage in any way remarkable; the obelisk, again, marked an interpolated or an objectionable word or passage.

**ASTEROIDS**. See **PLANETOLDS**.

**ASTEROPHYLLITES** (Gr. *aster*, a star, and *phylon*, a leaf), a generic name, under which are included many of the most abundant fossil plants of the coal-measures. The leaves are arranged in a stellated manner around the stems or branches. The A. are ranked among the exogenous or dicotyledonous fossils, but they are of doubtful affinity, and the exact determination of their place in the system has not yet been accomplished.

**ASTHMA** is a disease characterized by the breathing, previously natural, becoming difficult, and accompanied by wheezing and a distressing sense of tightness in the chest. A. generally appears at first after some inflammatory affection of the respiratory mucus membrane, and more especially in those who have led dissipated lives. In others, it is clearly hereditary, and frequently affects several members of the same family. A. may be habitual, or may occur in spasms, generally preceded by some premonitory symptoms, as in some by great drowsiness; others, says Dr. Hyde Salter, "know by extreme wakefulness and unusual mental activity and buoyancy of spirits; and I knew one case in which an attack of ophthalmia occurred."

The spasms may occur at any hour; but in nineteen out of twenty cases they awaken the patient from sleep between three and four in the morning. The horizontal position facilitating the flow of blood to the right side of the heart, and therefore to the lungs, the disadvantage at which the muscles of respiration are placed, and the greater readiness with which sources of irritation act during sleep, explain this fact.

Persons subject to A. scarcely dare fall asleep after any imprudence in diet; if they continue awake till their supper is fairly digested, and the stomach empty, they may go to sleep fearlessly, and have a good night's rest. The asthmatic paroxysm is thus described by Dr. Salter, the latest authority on this common but terrible disease: "The patient goes to bed and sleeps two or three hours, becomes distressed in his breathing, and begins to wheeze, so as to waken those in adjoining rooms. He awakes, changes his position, falls asleep again and again, and the miserable fight between A. and sleep may go on, till the increased suffering does not allow the patient longer to forget him-

self for a moment; he becomes wide awake, sits up in bed, throws himself forward, plants his elbows on his knees, and with fixed head and elevated shoulders, labors for breath like a dying man."

If the spasm is protracted, the oxygenation of his blood is imperfectly performed, owing to the scanty supply of air, and his extremities get cold and blue, but at the same time the violent muscular efforts at respiration cover him with sweat. The pulse is always small. The muscles of the back and neck attached to the ribs, act as extraordinary muscles of respiration. The chest enlarges during the paroxysm, but in it there is almost perfect stagnation of air. The respiratory tubes affected are very small, and the parts at which they are so constricted are constantly shifting.

The remedies for A. are numerous, but not to be depended on. They consist in paying attention to the digestive system, and in anti-spasmodics, either taken internally or by inhalation.

**ASTI** (*Asta Pompeia*), a city of Piedmont, in the government of Alessandria, lies on the left bank of the Tanaro, on the railway from Turin to Genoa, 26½ m. e.s.e. of Turin. Pop. '71, 19,466. It is a large town, with walls considerably dilapidated, and the streets generally very narrow and irregular. It is the seat of a bishop, and has a court of justice and a royal college. There is carried on a considerable trade in silk and woollen fabrics, leather, and hats, as well as in wines and agricultural produce. A. is a town of high antiquity, having been famous for its pottery before its capture by the Gauls in 400 B.C. On the occasion of its being again taken and destroyed in an irruption of the Gauls, it was rebuilt by Pompey, and received the name of *Asta Pompeia*. In the middle ages, A. was one of the most powerful republics of upper Italy. It was captured and burnt by the Emperor Frederick I. in 1155; and after a series of vicissitudes, it came into the possession of the Visconti of Naples, by whom it was ceded to the French, in whose hands it remained till the middle of the 16th c., when it came into the possession of the dukes of Savoy, as it still remains. Alfieri was born here, 1749.—The district of Asti, one of the six subdivisions of the government of Alessandria, is bounded on the w. and n. by the province of Turin, s. by Alba, s.e. by Alessandria proper, and n.e. by the province of Casale. The surface is hilly and picturesque. The soil rests upon limestone abounding in fossils, and is fertile, producing corn, fruit, and wine. It is celebrated for a fine white wine resembling champagne, called *vino d'Asti*. Silk is one of its most important products.

**ASTIGMATISM**, a defect in vision caused by the refraction of light by the eye differently in different planes. To an eye thus affected a pin-hole in a paper may appear round, but when the paper is moved a little, the circular hole will seem to be an ellipse, and by further removal it will show like a straight slit. A cylindrical or spherocylindrical lens will correct this defect in the sight.

**ASTLEY, PHILIP**, 1742-1814; an English equestrian, learning the art of riding by seven years' service in the cavalry. He established the first circus in London, and there and in Dublin and Paris, with Antoine Franconi, put up nearly 20 theaters or places for equestrian display. He wrote *Astley's System of Equestrian Education*, and two small works on military matters.

**ASTOLPHUS**, or **ASTULPHUS**, a Lombard king succeeding Rachis, in 748 A.D. He seized upon Ravenna and threatened Rome, but, on petition of pope Stephen II., Pepin of France in 754 crossed the Alps and defeated A., who obtained peace only after surrendering all his conquests. As soon as the French king departed, A. again menaced Rome, and again Pepin came to the help of the pope, shutting A. up in Pavia. While preparing for a new campaign, A. fell from his horse, and died three days later. He left no male heirs.

**ASTON, LUISE**, a German authoress of some note, but principally known for her zeal in behalf of the "rights of women." She was b. about 1820, in the vicinity of Halberstadt, and at an early age was married to a wealthy English manufacturer. Their union was not happy; perhaps her peculiar views of society and of the proper position of her sex contributed to the estrangement of their sympathies. After separating from her husband, she attracted public attention, especially in Berlin, by appearing on the streets in man's dress, smoking cigars, etc. This conduct brought her into several collisions with the police, and she was twice forced to leave the city. During the Slesvig-Holstein war, however, she found a nobler sphere for her woman's nature, and displayed the greatest heroism and self-sacrificing devotion as an hospital nurse. She has written various books; the principal are *Wild Roses* (1846) and *Frieschärter-Reminiscenzen* (1849), each of which contains 12 lyrical poems, none very able; *Meine Emancipation, Verweisung, und Rechtfertigung* (1846); a novel, *Aus dem Leben einer Frau* (1847); *Revolution und Contre revolution* (1849). In 1851, she married Dr. Meier of Bremen.

**ASTOR, JOHN JACOB**, an enterprising merchant, founder of the "American Fur Company," was b. in a village near Heidelberg, in Germany, 1763. After spending some years in London, he sailed to America in 1783, and soon invested his small capital in furs. By economy and industry, he so increased his means that after six years he had acquired a fortune of \$200,000. Although the increasing influence of the English fur companies in North America was unfavorable to his plans, he now ventured to fit out

two expeditions to the Oregon territory—one by land, and one by sea—the purpose of which was to open up a regular commercial intercourse with the natives. After many mishaps, his object was achieved in 1811, and the fur-trading station of Astoria (q.v.) was established; but the war of 1812 stopped its prosperity for a time. From this period A.'s commercial connections extended over the entire globe, and his ships were found in every sea. He d. in 1848, leaving property amounting to \$30,000,000. He left a legacy of \$350,000 for the establishment of a public library in New York. (Washington Irving's *Astoria*.)—His wealth was mainly inherited by his son WILLIAM, who continued to augment it till his death in 1875, when he is said to have left £10,000,000. He added £40,000 to his father's bequest for a public library. He was known as the "landlord of New York" from the extent of his property in that city. See *Chambers's Journal*, No. 632, fourth series.

ASTORGA, a city in the province of Leon, Spain, on a plain 2 m. from the Tuelto river; pop., est., 5000. Napoleon made A. his headquarters while pursuing Sir John Moore in 1809; the next year it was taken by Junot, and in 1812 retaken by the Spaniards. It has a fine, ancient, Gothic cathedral, and around it are the ruins of the old city of *Asturica Augusta*.

ASTORGA, EMANUELE D', a musician, celebrated partly on account of his personal history, was b. in Sicily in 1680. His father, a baron of Sicily, in the contest respecting the annexation of the island to Spain, was delivered over to the enemy by his own mercenary soldiers, and was executed in 1701; while his wife and son (Emanuele) were barbarously compelled to witness the tragedy. The wife died on the spot, and the son fell into a state of unconsciousness. Afterwards, through the interest of the Spanish princess Ursini, he was educated in a monastery at Astorga in Leon, from which he derived his name. Here he especially devoted himself to music, and made such progress that he was invited to the court of the duke of Parma. His patron, erroneously suspecting that his daughter was receiving his addresses, sent him away to the court of the emperor Leopold. After Leopold's death, A. traveled through Europe, and is supposed to have d. in a Bohemian monastery. His best work is the *Stabat Mater*, a masterly composition, of which the original score is preserved in Oxford.

ASTORIA, formerly a large village in Queens co., N. Y., now incorporated in Long Island city (q.v.). It is at the junction of the East river and the sound, opposite Hell-gate, and was for many years a favorite summer residence for New Yorkers.

ASTORIA, originally a fur-trading station on the left bank of the Columbia, near the Pacific, named from its founder, John Jacob Astor. It demands notice here chiefly as having been a main point in the American claim to the Oregon territory (q.v.).

ASTOR LIBRARY, in the city of New York, founded by John Jacob Astor, and largely increased by his son, William B. Astor. The edifice on Lafayette place is excellently adapted to the purpose, and occupies nearly the whole of a lot 235 by 120 ft. It is of brick, of the Byzantine order, finely ornamented with brown-stone moldings. The original library room is 100 by 64 ft., and 50 ft. high, and is reached by 36 marble steps. This building was opened Jan. 9, 1854, but it soon became too small for its purpose, and William B. Astor erected a building adjoining, exactly corresponding in style and size, which was opened Sept. 1, 1859. The A. L. is entirely free, though no book can be taken away. In languages it has no superior in the country. The books are nearly all of practical value, fiction being entirely subordinate to works on history, arts, sciences, etc. From the report for the year 1879, the following facts are taken: The fund for the maintenance of the library is \$421,000, and the endowment amounts to \$1,112,957. During the year, 5839 vols. were added, and the whole number of vols. at the end of the year was 189,114. The number of readers in the halls and alcoves in 1879 was 239,042, a daily average of about 214. Although the number of general readers has doubled in ten years, there was a slight falling off in their number as compared with the previous year, and an increase in the alcove readers. This increase, which has been generally uniform during ten years past, has shown the increasing attractions of the library for study and research, in drawing to it students not only from the city and state, but from colleges and universities in other parts of the country and even from Europe. The trustees report that in Nov., Mr. John Jacob Astor conveyed to the library, by deed of gift, three lots of ground adjoining, 75 ft. front by 100 ft. in depth, and announced his intention of erecting thereon an addition to the present library building, 65 ft. in front by 100 ft. deep, of the same general style as the present edifice. With this addition the library will have a front of 195 ft., and a depth of 100 ft., with an increased capacity for books amounting to 120,000 volumes. The number of readers in the halls had risen from 25,709 in 1872, calling for 78,935 books, to 51,725 in 1879, and 147,112 books. The alcove readers were 5204 in 1870, and 7307 in 1879; the whole number of volumes in the library in 1870 was 140,558; in 1879 it was 189,114.

ASTRABAD, a t. in the n. of Persia, capital of the province of the same name, is built at the foot of the northern slope of the Elbruz mountains, on a small river which runs into A. bay, at the s.e. extremity of the Caspian, from which it is distant 20 miles. Lat. 36° 50' n., long. 54° 31' e. It was long the residence of the Kajar princes, from whom the present shah of Persia is descended; but on account of its situation in a

remote corner of the kingdom, it was not advanced to the dignity of the metropolis of Persia. Teheran, at the foot of the chain of mountains which separates Iran from Mazanderan, became the capital; and since then the importance of A. has considerably sunk. It is still inclosed by a dry ditch and mud-wall, 3 m. in circumference, but its great towers have disappeared. Trade has increased since the establishment of a Russian consulate. The causeway constructed by Shah Abbas is kept in good repair, and connects A. with Khorassan, Afghanistan, etc. Pop. 6000 to 8000. The t. is a very unhealthy residence during the summer rains.

**ASTRÆA**, daughter of Zeus and Themis, or of Astræus and Aurora, was the goddess of justice, the last of all the goddesses who left the earth when the golden age had passed away and men began to forge weapons and perpetrate acts of violence. She took her place in heaven as the constellation Virgo in the zodiac.—Greek art usually represented her with a pair of balances in her hand, and a crown of stars on her head.—A. is also the name of one of the planetoids (q. v.).

**ASTRÆA**. See CORAL and MADREPORE.

**ASTRAGALUS**, a bone of the foot, which, by a convex upper surface and smooth sides, forms, with the leg-bones, the hinge of the ankle-joint. Its lower surface is concave, and rests on the *os calcis*, or heel-bone, to which it is attached by a strong ligament. In front, it has a round head, which rests in the concavity of the scaphoid, another bone of the tarsus, and upon an elastic ligament, its pressure upon which gives in a great measure the necessary elasticity to the foot: it is at this joint that inversion and eversion of the foot take place. It will be seen that the A. is a bone of great importance to the member, as it supports the weight of the body in standing, and enters into most of the movements of the foot. It is occasionally displaced, generally in front of the outer ankle.

**ASTRAGALUS**, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*. The pod is more or less perfectly 2-celled. The leaves are pinnate, with a terminal leaflet. The species are numerous, natives chiefly of the temperate and colder parts of the old world, shrubby, and often spiny, or unarmed and herbaceous. A number of the shrubby species yield the substance called tragacanth (q. v.), or gum tragacanth.—*A. bootticus*, an annual, native of the s. of Europe, with upright branching stems, is cultivated in Hungary, Germany, and other parts of Europe, for its seeds, which are roasted, ground, and used as a substitute for coffee, or mixed with it to improve its flavor.—The sweet milk-vetch, or wild licorice (*A. glycyphyllos*), a native of Britain and other parts of Europe, perennial, with long and very thick roots, which penetrate deep into the soil, and almost prostrate stems, 3 ft. in length, is occasionally cultivated for food of cattle, yielding a very abundant herbage. Cattle are not fond of it at first, but are said to become fond of it after being accustomed to it for some time. The roots have somewhat of the sweetness of licorice.

**ASTRAKHAN**, originally a province of the Mogul empire, but united with the Russian empire in 1554. At present, A. forms one of the s.e. governments of Russia in Europe, and is bounded on the s. by the Caspian sea and the Caucasus; on the w., by the country of the Don Cossacks; on the n., by the government of Saratov; and on the e., by Orenburg. Area, 50,000 sq. m.; pop. '70, 601,514. The province of A. is almost entirely a barren waste, the only fertile portions being the banks of the Volga, which divides the province into two equal parts. Salt is procured from the marshes of the steppes, considerable numbers of cattle are reared, and the annual value of the sturgeon-fishing in the Volga is as much as 2,500,000 rubles (about £400,000). The climate varies from 70° F. in summer, to 13° in winter. The population is composed of diverse elements—Russian, Tartar, Georgian, Armenian, Bokharese, Persian, and Hindoo.

**ASTRAKHAN**, the chief t. of the government of the same name, is situated on an island of the Volga, and near the Caspian sea, in lat. 46° 21' n., and long. 48° 4' e. It is the seat of a Greek archbishop and an Armenian bishop; has 37 Greek, 2 Roman Catholic, 1 Protestant, and 2 Armenian churches; 15 mosques, an Indian temple, a gymnasium, a seminary for priests, a botanical garden, and many manufactories. Pop. '67, 47,839. The houses are mostly of wood, and irregularly built. The fisheries in the Volga supply occupation to great numbers of the inhabitants of A. and its neighborhood. The principal exports are leather, linen, and woolen goods, salted sturgeon, caviare, and isinglass. Imports consist chiefly of gold-embroidered silken goods from Persia, silk stuffs, woolen goods, rice, rhubarb, raw silk, drugs, etc. From July to Oct. the neighborhood of A. is frequently visited by swarms of locusts.—A. is the name of a fine description of fur, the produce of a variety of sheep found in Bokhara, Persia, and Syria.

**ASTRAL SPIRITS**. The star (Gr. *astron*) and fire worship of the eastern religions rested on the doctrine that every heavenly body is animated by a pervading spirit, forming, as it were, its soul; and this doctrine passed into the religio-physical theories of the Greeks and Jews, and even into the Christian world. In the demonology or spirit-systems of Christendom in the middle ages, A. S. are conceived of sometimes as fallen angels, sometimes as souls of departed men, sometimes as spirits originating in fire, and hovering between heaven, earth, and hell, without belonging to any one of these provinces. Their intercourse with men and their influence were variously represented,

according to the notion formed of their nature. As the belief in spirits and witchcraft reached its height in the 15th c., the demonologists, or special students of this subject, systematized the strange fancies of that wild period; and A. S. were made to occupy the first rank among evil or demoniacal spirits. Paracelsus, however, and others attributed to every human being an astral spirit, or sidereal element, in which the human soul, or spirit proper, is thought to inhere, and which lives for a time after the person dies.

**ASTRINGENTS**, medicines employed for the purpose of contracting the animal fibers and canals, so as to check fluxes, hemorrhage, and diarrhea. The drugs most commonly used as A. are alum, catechu, oak-galls, rhatany-root, etc. Many of the vegetable A. owe that property, in whole or in great part, to tannin. A severe degree of cold is a powerful astringent.

**ASTROCA'RYUM** (from the Gr. *astron*, a star, and *karyon*, a nut), a genus of palms, of which about sixteen species are known, natives of tropical America, remarkable for the abundance of acute and formidable spines—in some cases a foot long—with which almost every part—stem, leaves, spathe, and fruit-stalk—is armed. They have beautiful pinnated leaves; some of them are lofty, others are of very moderate height, as 8 to 15 ft., whilst some are almost or altogether stemless. The fruit of some species is eatable—a juicy pulp covering a stony seed—as the fruit of the MURUMURÚ palm (*A. murumuru*), the pulp of which is said to resemble a melon in flavor, has a sort of musky odor, and is highly esteemed. It is a palm of only about 8 to 12 ft. high, abundant about Pará and elsewhere on the Amazon. Cattle roam the forests in quest of its fruit, and swine fatten on the seed, which they crush with their teeth, although to break it requires a smart blow of a hammer, and in hardness it almost resembles vegetable ivory. Another edible fruit is that of the TUCUMÁ palm (*A. tucuma*), abundant in the same regions. These fruits are about an inch long, the murumurú ovate, the tucumá almost globular. The tucumá palm is 30 to 40 ft. high, the stem encircled with narrow rings of black spines, which are disposed with beautiful regularity. The TUCUM palm (*A. vulgare*), a species quite distinct from the tucumá, and more lofty, is of great importance to the Indians, and in places where it is not indigenous, is cultivated with care for the sake of the epidermis of its unopened leaves, of which they make cordage, very useful for bow-strings, fishing-nets, etc. The fiber is at once fine, strong, and durable, and may yet perhaps become important as an article of commerce. Beautiful hammocks are made of tucum thread, which are sold at about £3 each, or if ornamented with feather-work borders, at twice that sum. Martius, in his great work on palms, has, by mistake, represented the tucumá instead of the tucum palm as yielding this fiber. See Wallace, *Palm Trees of the Amazon*, Lond., 1853. The fiber is obtained by cutting down the terminal bud or column of unopened leaves which rises from the center of the crown of foliage. The tender leaflets are then carefully stripped of their epidermis, in pale, ribbon-like pellicles, which shrivel up almost to a thread. These are tied in bundles and dried, and are afterwards twisted into thread, or made into thicker cords, by mere rolling and manipulation.

**ASTROLABE** (from two Greek words signifying "to take the stars"), the name given by the Greeks to any circular instrument for observing the stars. Circular rings, arranged as in the armillary sphere (q.v.), were used for this purpose. A projection of the sphere upon a plane, with a graduated rim and sights for taking altitudes, was known as an A. in the palmy days of astrology, and was the badge of the astrologer. The A. has been superseded by the more perfect instruments of modern astronomy.

**ASTROLOGY** meant originally much the same as *astronomy*, "the knowledge of the stars," but was at length restricted to the science of predicting future events, especially the fortunes of men, from the positions of the heavenly bodies. This was considered the higher, the real science; while the mere knowledge of the stars themselves, their places and motions (astronomy), was, till a very recent period, cultivated mostly with a view to (judicial) astrology. A. is one of the most ancient forms of superstition, and is found prevailing among the nations of the east (Egyptians, Chaldeans, Hindoos, Chinese) at the very dawn of history. The Jews became much addicted to it after the captivity. It spread into the west and to Rome about the beginning of the Christian era. Astrologers played an important part at Rome, where they were called Chaldeans and mathematicians; and though often banished by the senate and emperors under pain of death, and otherwise persecuted, they continued to hold their ground. The Roman poet Manilius, author of an astronomical poem still extant, was addicted to A.; and even Ptolemy the astronomer did not escape the infection, which in his time had become universal. It accords well with the predestinarian doctrines of Mohammedanism, and was accordingly cultivated with great ardor by the Arabs from the 7th to the 13th century. Some of the early Christian fathers argued against the doctrines of A., others received them in a modified form. In its public capacity, the Catholic church several times condemned the system; but many zealous Catholics, even churchmen have cultivated it. Cardinal d'Ailly, "the eagle of the doctors of France" (d. 1420), is said to have calculated the horoscope of Jesus Christ, and maintained that the deluge might have been predicted by A. For centuries the most learned men continued devoted to this delusive science; Regiomontanus, the famous mathematician Cardan, even Tycho Brahé and Kepler, could not

shake off the fascination. Kepler saw the weakness of A. as a science, but could not bring himself to deny a certain connection between the positions ("constellations") of the planets and the qualities of those under them. The Copernican system gave the death-blow to A. When the earth itself was found to be only one of the planets, it seemed absurd that all the others should be occupied in influencing it. The argument has really little force, but it produced the effect. Belief in A. is not now ostensibly professed in any Christian country, though a few solitary advocates have from time to time appeared, as J. M. Pfaff in Germany, *Astrologie* (Bamb., 1816). But it still holds sway in the east, and among Mohammedans wherever situated. Even in Europe the craving of the ignorant of all countries for divination is still gratified by the publication of multitudes of almanacs containing astrological predictions, though the writers no longer believe in them.

Many passages of our old writers are unintelligible without some knowledge of astrological terms, numbers of which have taken root in the language. In the technical rules by which human destiny was foreseen, the heavenly *houses* played an important part. Astrologers were by no means at one as to the way of laying out those houses. A very general way was to draw great circles through the n. and s. points of the horizon, as meridians pass through the poles, dividing the heavens, visible and invisible, into twelve equal parts—six above the horizon, and six below. These were the twelve houses, and were numbered onward, beginning with that which lay in the e. immediately below the horizon. The first was called the house of life; the second, of fortune, or riches; the third, of brethren; the fourth, of relations; the fifth, of children; the sixth, of health; the seventh, of marriage; the eighth, of death, or the upper portal; the ninth, of religion; the tenth, of dignities; the eleventh, of friends and benefactors; the twelfth, of enemies, or of captivity. The position of the twelve houses for a given time and place—the instant of an individual's birth, for instance—was a *theme*. To construct such a plan was to *cast* the person's nativity. The houses had different powers, the strongest being the first; as it contained the part of the heavens about to rise, it was called the *ascendant*; and the point of the ecliptic cut by its upper boundary was the *horoscope*. Each house had one of the heavenly bodies as its *lord*, who was strongest in his own house.

**ASTRONOMY** (Gr. *astron*, a star, *nomos*, a law) teaches whatever is known of the heavenly bodies. A. may be properly divided under three heads. 1. *Geometrical or Mathematical A.*, including the exact determination of the numerical and geometrical elements of the heavenly bodies—that is, their distances, shapes, magnitudes, the figures they describe in their motions, etc. 2. *Physical A.*, or the nature of the powers or forces that carry on the heavenly motions, the laws that they observe, and the calculation of the motions from a knowledge of these laws. 3. *Sidereal A.*, or whatever is ascertained regarding the universe of the fixed stars. *Practical A.* might form another division, which would include a knowledge of the various astronomical instruments; and a familiarity generally with the rules and calculations by which the requisite results are deduced from observations.

Such parts of this extensive subject as are deemed suited to the present work, will be found under their appropriate heads, such as ABERRATION OF LIGHT, CIRCLE, COMET, EQUATOR, FIXED STARS, LIBRATION, PARALLAX, PLANETIDS, PLANETS, PRECESSION, REFRACTION, SOLAR SYSTEM, SUN, TIME, TRANSIT INSTRUMENT, etc. A brief sketch of the history of astronomical discovery is all that can be attempted in the present article.

The history of A. dates from a very early period. It is the most ancient of all the sciences. The Chinese, Hindoos, Chaldeans, Egyptians, and even the Greeks, are known to have investigated the heavens very long before the Christian era. But with the first four nations, A. may be said to have been a sentiment rather than a science—a vague notion built up out of crude speculations, rather than a correct theory founded on systematic observation. In China, A. was intimately associated with state politics; the Indians, Chaldeans, and Egyptians made it a matter of religion; and each of these nations applied it to astrological purposes. In Greece alone was it prosecuted for its own sake.

The Chinese, Chaldeans, Hindoos, and Egyptians each claim the honor of having been the first students of A., and each has had advocates to support its claim. The Tirvalore tables (asserted by the Hindoos to belong to an epoch of 3102 years B.C.—the commencement of the Cali-yug, or iron age, of their mythology—at which period a conjunction of the sun, moon, and planets is said to have occurred) are, so far as their date is concerned, altogether unreliable. Modern calculations have conclusively proved that no such conjunction could possibly have taken place at the time specified; and the elements of the tables are, in the general opinion of scientific men, of a character far in advance of the actual observations of that period. There is no doubt that the epoch is fictitious—that the date of these tables is fixed much earlier than their internal evidence justifies; but it is matter of dispute whether they were the result of the observations of Hindoos themselves at some later period before the Christian era, or whether they were constructed after that era from data furnished to them by the Arabs or Greeks. Those who hold the former view, quote the well-known mathematical attainments of the Indians, and their aversion to intercourse with foreigners, as arguments in its favor; those who support the latter, point out that the tables are a mean between those of Ptolemy and

Albategnius, or Al Batani, a distinguished Arabian astronomer, and therefore likely to have been derived from these two sources. Those who are interested in the question of the originality of these tables, may refer to Delambre, and to Bailly's *Hist. de l'Astronomie Indienne*.

The Chinese have astronomical annals claiming to go back 2857 years B.C. In these there is little record of anything but of the appearance of comets and solar eclipses; and regarding the latter phenomena, they tell nothing, save the fact and date of their occurrence. Professional astronomers were compelled to predict every eclipse under pain of death. The popular idea was that an eclipse was a monster having evil designs on the sun, and it was customary to make a great noise by shouting, beating of gongs, etc., in order to frighten it away from its solar prey. The many eclipses which the Chinese report have been recalculated, but not more than one anterior to the time of Ptolemy could be verified. At an early period, however, the Chinese appear to have been acquainted with the luni-solar cycle of 19 years (introduced into Greece by Meton, and since known as the Metonic cycle), and they had also divided the year into 365½ days. Solstitial observations are said to have been made by a gnomon in the 11th c. B.C. To the burning of all scientific books by one of their princes (Tsin-Chi-Hong-Ti), 221 B.C., the Chinese attribute the loss of many theories or methods previously in use. The precession of the equinoxes was not known to the Chinese until 400 A.D., but long prior to that they were familiar with the motion of the planets.

The mass of evidence seems in favor of the plains of Chaldea being the primal seat of observative A. The risings and settings of the heavenly bodies and eclipses were subjects of observation and notation by their priests at a very remote period. Simplicius and Porphyry mention that Aristotle had transmitted to him from Babylon, by order of Alexander the great, a catalogue of eclipses observed during 1908 years preceding the conquest of that city by the Macedonians. Ptolemy gives six of the eclipses from this catalogue, but the earliest does not extend further back than 720 B.C. The probability therefore is that the statement of Simplicius, as to their early date, is an exaggeration. In these observations, the time is only given in hours, and the part of the diameter eclipsed within a quarter; but rough as they are, they are the earliest reliable observations extant; and a comparison of them with modern observations, led Halley to the discovery of the doctrine of the moon's acceleration—that is, that she now moves round the earth with greater velocity than formerly. It is remarkably illustrative of their habit of diligent observation, that the Chaldeans were acquainted with the cycle of 6585½ days, during which the moon makes about 228 synodical revolutions, and experiences the same number of eclipses, alike, too, in order and magnitude, comparing cycle with cycle. The clepsydra as a clock, the gnomon for determining the solstices, and a hemispherical dial for ascertaining the positions of the sun, were used by the Chaldeans, and they have the credit of the invention of the zodiac and the duodecimal division of the day.

The Egyptians, it is supposed, were the first instructors of the Greeks in A. They do not, however, appear to have observed much for themselves. The meaning of what data they have left behind them can be guessed at only in a few instances. No mention is made by Ptolemy of the idea ascribed to them, that the planets Mercury and Venus moved round the sun; the probability therefore is, Ptolemy not being likely to overlook such a novel theory, that they entertained no such notion at the time of his visit, but that it is an after-thought of more recent ages. From the accuracy with which some of the pyramids face the cardinal points, there is a supposition that they must have been erected for astronomical purposes; but if it be true, as is stated, that Thales taught the Egyptians how to find the height of the pyramids by the shadow, and that the latter informed Herodotus that the sun had twice been seen to rise in the west, the conclusion is that the A. of the ancient Egyptians was very meager and absurd.

Up to this time, A. is little else than tradition. The Greeks have the honor of elevating it into a reliable history, and to the dignity of a science. Thales (640 B.C.), the founder of the Ionic school, laid the foundation of Greek A. He it was who first propagated the theory of the earth's sphericity. The sphere he divided into five zones. He predicted the year of a great solar eclipse, but this it is now supposed he must have casually succeeded in doing—the Greeks at this time having no observations of their own to guide them—by means of the Chaldean saros, or period of 18 years and 10 days, which gives a regular recurrence of eclipses. He made the Greeks, who, prior to his time, were content to navigate their vessels by the Great Bear—a rough approximation to the north—acquainted with the lesser constellation of that name, a much better guide for the mariner. His system, however, contained a good deal of absurdity. Among other things, he held that the stars were composed of fire, and that the earth was the center of the universe. The successors of Thales held opinions which in many respects are wonderfully in accordance with modern ideas. Anaximander, it is said, held that the earth moved about its own axis, and that the moon's light was reflected from the sun. To him is also attributed, on somewhat slender authority, the belief in the grand idea of the plurality of worlds. Anaxagoras, who transferred the Ionic school from Miletus to Athens, is said to have offered a conjecture that, like the earth, the moon had habitations, hills, and valleys.

Pythagoras (500 B.C.), who was the next astronomer of eminence, was very far in ad-

vance of his predecessors. He promulgated, on grounds fanciful enough, the theory, the truth of which, however, has been since established, that the sun is the center of the planetary world, and that the earth circulates round it. Pythagoras also first taught that the morning and evening star were in reality one and the same planet. But the views of Pythagoras met with little or no support from his successors until the time of Copernicus. Between Pythagoras and the advent of the Alexandrian school, nearly a couple of centuries later, the most prominent names in astronomical annals are those of Meton (433 B.C.), who introduced the luni-solar cycle, as already intimated, and, in conjunction with Euctemon, observed a solstice at Athens in the year 424 B.C.; Callippus (330 B.C.), who improved the Metonic cycle; Eudoxus of Cnidus (370 B.C.), who brought into Greece the year of 365½ days, and wrote some works on A.; and Nicetas of Syracuse, who is reported to have taught the diurnal motion of the earth on its axis.

To the Alexandrian school, owing its existence to the munificent Ptolemies, we are indebted for the first systematic observations in A. Hitherto the truths of A. rested on no better evidence than the conjectures of sagacious minds, and these being opposed to the testimony of the senses, met with but little acceptance from the world. The Alexandrian school originated a connected series of observations relative to the constitution of the universe. The positions of the fixed stars were determined, the paths of the planets carefully traced, and the solar and lunar inequalities more accurately ascertained. Angular distances were calculated with instruments suitable to the purpose by trigonometrical methods, and ultimately the school of Alexandria presented to the world the first system of theoretical astronomy that had ever comprehended an entire plan of the celestial motions. The system we know to be false, and inferior to the Pythagorean notions; but it had the merit of being founded upon a long and patient observation of phenomena, a principle which finally brought about its own destruction, while the previous theories were the results of pure hypothesis.

The most interesting circumstances connected with the early history of the Alexandrian school are the attempts made to determine the distance of the earth from the sun, and the magnitude of the terrestrial globe. Aristarchus of Samos—the pioneer of the Copernican system, as Humboldt calls him—is the author of an ingenious plan to ascertain the former. See ARISTARCHUS OF SAMOS.

Among other eminent members of this school were Timocharis and Aristyllus, who made the observations which, together with observations of his own, enabled Hipparchus (q.v.) to discover the precession of the equinoxes; Eratosthenes (q.v.), who was the first who attempted to determine on true principles the magnitude of the earth, and to clear, as Humboldt expresses it, “the description of the earth from its fabulous traditions;” and Autolycus, whose books on A. are the earliest extant in the Greek language.

We have now arrived at by far the greatest name we have yet met in astronomical science—that of Hipparchus of Bithynia (160–125 B.C.), and here may be said to begin the real written history of scientific A.; for not until his era were there facts correct enough and sufficient in number upon which to build a system. Hipparchus was at once a theorist, a mathematician, and an observer. He catalogued no less than 1081 stars. This is the first reliable catalogue we have. He discovered, as we have already mentioned, the precession of the equinoxes; he determined, with greater exactitude than his predecessors had done, the mean motion as well as the inequality of the motion of the sun; and also the length of the year. He also determined the mean motion of the moon, her eccentricity, the equation of her center, and the inclination of her orbit; and he suspected the inequality afterwards discovered by Ptolemy (the evection). He invented processes analogous to plane and spherical trigonometry, and was the first to use right ascensions and declinations, which he afterwards abandoned in favor of latitudes and longitudes.

For more than two centuries and a half after the demise of this indefatigable astronomer, we meet with no name of note. Ptolemy (130–150 A.D.) is the next who rises above the mass of mediocrities. Besides being a practical astronomer, he was accomplished as a musician, a geographer, and mathematician. His most important discovery in A. was the libration or evection of the moon. He also was the first to point out the effect of refraction. He extended and improved many of the theories of Hipparchus, and was the founder of the false system known by his name, and which was universally accepted as the true theory of the universe, until the researches of Copernicus exploded it. The Ptolemaic system, expounded in the *Great Collection*, or, as it was called by the Arabs, the *Almagest*—from which source most of our knowledge of Greek A. is derived—placed the earth immovable in the center of the universe, making the entire heavens revolve round it in the course of twenty-four hours.

With Ptolemy closes the originality of the Greek school. His successors were men of no mark, confining themselves for the most part to astrology, or to comments on earlier writers. It is to the Arabs that we owe the next advances in A. They commenced making observations 762 A.D., in the reign of the Caliph Al Mansur, who gave great encouragement to science, as did also his successors, the “good Haroun Alraschid” and Al Mamoun, both of whom were themselves diligent students of A. For four centuries the Arabs prosecuted the study of the science with assiduity, but they are chiefly meritorious as observers. They had little capacity for speculation, and throughout held the Greek theories in superstitious reverence. They, however, determined with

much more accuracy than the Greeks had done the precession of the equinoxes, the obliquity of the ecliptic, and the solar eccentricity; and the length of the tropical year was ascertained within a few seconds of the truth. The most illustrious of the Arabian school were Albategnius or Al Batani (880 A.D.), who discovered the motion of the solar apogee (see ANOMALISTIC YEAR), and who was also the first to make use of sines and versed sines instead of chords; he corrected the Greek observations, and was altogether the most distinguished observer between Hipparchus and the Copernican era; and Ibn-Yunis (1000 A.D.), an excellent mathematician, who made observations of great importance in determining the disturbances and eccentricities of Jupiter and Saturn, and who was the first to use cotangents and secants.

In the northern part of Persia, an observatory was erected by a descendant of the renowned warrior Genghis Khan, where some tables were constructed by Nasir-Eddin; and at Samarcand, Ulugh Beg, a grandson of Timur, made, in 1433 A.D., many observations, and the most correct catalogue of stars which, up to his time, had been published.

In the 13th c., A. was again introduced into western Europe, the first translation from the *Almagest* being made under the emperor Frederick II. of Germany, about 1230; and in 1252 an impulse was given to the science by the formation of astronomical tables under the auspices of Alfonso X. of Castile. An Englishman, named Holywood (Sacrobosco), in 1220 wrote a book of great repute in its day on the spheres, chiefly abridged from Ptolemy; and among others who did much to promote a taste for A. were Purbach (1460), Regiomontanus (John Muller), who died in 1476, and Waltherus, a pupil of the latter, who made numerous observations of merit.

We now come to the illustrious name of Copernicus (b. 1473, d. 1543), to whom was reserved the grand honor and the danger—for there is ever danger in bringing old notions into disrepute by introducing new systems of truth—of exploding the Ptolemaic idea, and of promulgating a correct though imperfect theory of the universe. His system is in some part a revival and systematic application of the opinions said to have been held by Pythagoras. It makes the sun the immovable center of the universe, around which all the planets revolve in concentric orbits, Mercury and Venus within the earth's orbit, and all the other planets without it. In the Copernican theory, there were many of the old notions which have since been exploded. It is a current belief that Copernicus, afraid to state boldly such heterodox views of the universe as those he entertained, gave them forth in the form of an hypothesis. Humboldt, in his second volume of *Cosmos* (p. 345), denies that he did so. This distinguished authority says: "The language of Copernicus is powerful and free, and bursts forth from his inmost convictions, and thus sufficiently refutes the ancient opinion, that he has brought forward the system which is immortalized by his name, as an hypothesis made for the convenience of calculating astronomers, or for one which has but a probable foundation." The same author also refutes the popular notion that Copernicus died a few hours after receiving a printed copy of his book. He was broken down in body and mind when his work *On the Revolutions of the Heavenly Bodies* was brought to him, but he did not die until "many days afterwards, on the 24th May, 1543."

Among the contemporaries of Copernicus were Rheinhold, who constructed the Prutenic tables; Recorde, who was the first to write on A. in English; and Nonius, a Portuguese, who invented a method for dividing the circle. The study of A. was also much aided about this time by the liberality of the Landgrave of Hesse-Cassel, William IV.

Decidedly the most industrious observer and eminent practical astronomer from the time of the Arabs to the latter half of the 16th c. was Tycho Brahé (b. 1546, d. 1601). Considerable odium attaches to him on account of his repudiation of the Copernican system, but it should not be forgotten that in the time of Tycho that system was not supported by the conclusive evidence we are now in possession of. Tycho's system, which made the sun move round the earth, and all the other planets round the sun, they moving with it round the earth, explained all natural phenomena then observed equally well, while it must have appeared more probable than the crude and, at that era, undemonstrable theories of Copernicus. Tycho Brahé compiled a catalogue of 777 fixed stars, more perfect than any that had previously appeared. He made the first table of refractions, and discovered the variation and annual equation of the moon, the inequalities of the motion of the nodes, and the inclination of the lunar orbit, and rejected the trepidation of the precession, which had hitherto injuriously affected all tables. He also made some interesting cometary investigations.

To his researches are mainly due the discovery by Kepler (b. 1571, d. 1630) of those famous laws which have rendered his name immortal. See KEPLER. To Kepler is due the credit of divesting the Copernican system of its absurdities. Kepler is also said to have had some notion of the law of gravitation.

Galileo Galilei (b. 1564, d. 1642) first applied the telescope (which he made from a general description of the instrument of Hans Lipperhey of Holland, who was the first inventor of the telescope) to the investigation of the heavens. He was rewarded by the discovery of the inequalities on the moon's surface. The important discoveries of the four satellites of Jupiter, the ring of Saturn—not then distinctly recognized as a circle—the spots on the sun, and the crescent form of Venus, followed in quick succession.

For propagating the Copernican doctrine of the world, Galileo incurred the displeasure of the priests, and was compelled by the Inquisition to retract his opinions.

But the eternal laws of nature are not to be suspended by the recantation of a philosopher forced by the tyranny of priestcraft. The earth moved grandly on round the sun in spite of both; and scientific truth was now too old to remain in the restrictive leading-strings of any ecclesiasticism.

The next great epoch in the history of A. brings us to England and Newton (b. 1642, d. 1727). In the interval, practical A. had profited largely by the logarithms of Napier; the mathematical researches of Descartes; the application of the telescope to the quadrant by Gascoigne, an Englishman, and afterwards by Auzout and Picard; by Römer's discovery of the progressive motion, and measurement of the velocity, of light; by the invention of Verner; and the application of the pendulum to clocks by Huyghens, who also brought into use the spiral spring, and made some valuable observations on the ring and satellites of Saturn; as well as by the investigations of Norwood, Horrocks, Hooke, Hevelius, Gilbert, Leibnitz, and Dominicus Cassini, to the last of whom especially the scientific world owes much. Among a variety of other valuable observations and discoveries may be mentioned his thorough investigation of the zodiacal light, his determination of the rotations of Jupiter and Mars, and of the motions of Jupiter's satellites from their eclipses, his discovery of the dual character of Saturn's ring, and also of four of his satellites. Newton's fame rests upon his discovery of the law of gravitation, upon which the common belief is he was led to speculate by the fall of an apple. Newton announced his discovery in the *Principia* in 1687, which was briefly that every particle of matter is attracted by, or gravitates to, every other particle of matter, with a force inversely proportional to the squares of their distances. The first gleam of this grand conclusion is said to have so overpowered Newton that he had to suspend his calculations, and call in a friend to finish the few arithmetical computations that were incomplete. This discovery is perhaps the grandest effort of human genius of which we have any record. Newton also made the important discovery of the revolution of comets round the sun in conic sections, proved the earth's form to be an oblate spheroid, gave a theory of the moon and tides, invented fluxions, and wrote upon Optics.

While the foundations of physical A. were thus broadly laid by Newton, Flamsteed—the first astronomer-royal at Greenwich, to whom, until recently, scant justice has been done—and Halley were greatly improving and extending the practical department of the science. To the former we are indebted for numerous observations on the fixed stars, on planets, satellites, and comets, and for a catalogue of 2884 stars. His *Historia Cœlestis* formed a new era in sidereal A. Dr. Halley, who succeeded Flamsteed as astronomer-royal, discovered the accelerated mean motion of the moon, and certain inequalities in Jupiter and Saturn, but he is most famed for his successful investigations into the motions and nature of comets. His successor was Dr. Bradley, who, in the year of Newton's death, made the important discovery of the aberration of light, which furnishes the only direct and conclusive proof we have of the earth's annual motion. To him also we are indebted for our knowledge of the nutation of the earth's axis. He was, besides, an unwearied observer, and left behind him at his death upwards of 60,000 observations. Altogether, Bradley's is deservedly one of the most honored names in modern A. Dr. Maskelyne, who was appointed to the observatory after Bradley, originated the *Nautical Almanac*.

Merely to mention the names of men who from the death of Bradley to the present time have added, by theory and practice, to our knowledge of A., would extend this synopsis much beyond the limit necessarily assigned to it. If the 18th c. opened with lustre derived from the physical demonstrations of Newton, it closed magnificently with the telescopic discoveries of Sir William Herschel, who added to our universe a primary planet (Uranus) with its satellites, gave two more satellites to Saturn, resolved the milky-way into countless myriads of stars, and unraveled the mystery of nebulae and of double and triple stars. Laland, Lagrange, Lacaille, and Delambre, in the latter half of the 18th c., did much by their researches and analyses to systematize and improve the science of A. The instrumental means of observation were also, during that time, brought to high perfection. Laplace, in his great work the *Mécanique Céleste* (1799–1808), gave what further proof was needed of the truth and sufficiency of the Newtonian theory.

The 19th c. opened with the discovery of the four small planets—Ceres, in 1801, by Piazzi; Pallas and Vesta by Olbers—the former in 1802, and the latter in 1807; and Juno, by Harding, in 1804. In 1845, Hencke discovered the fifth of this group revolving between Mars and Jupiter, to which the name of Astrea was given; and by the end of 1879, 200 planetoids (q.v.) had been discovered. The greatest event of the century has been the discovery of the planet Neptune in 1846.

Observations upon Uranus had shown the motions of that planet to present great irregularities, which could not be explained by the action of Jupiter and Saturn; and after carefully examining the analytical theory of Uranus, Leverrier, a young academician of France, in the summer of 1846, published the elements of an undiscovered planet, the cause of the perturbations. He boldly predicted its existence, calculated its mass, and referred to its place in the heavens; and scarcely a month afterwards, on the 23d of Sept., the hitherto concealed object (Neptune) was found by M. Galle of Berlin. But

it has only been by accidental circumstances that France has the honor of this remarkable achievement. Mr. Adams of Cambridge had arrived at results more perfect than those of Leverrier, and had communicated them to Mr. Challis, professor of A. at Cambridge in Sept., 1845, a year before the discovery of the planet, and nearly a year before the publication of Leverrier's final calculations. Mr. Challis, it appears, commenced a search for the planet on July 29th, and on Aug. 4th and 12th, he actually seized the planet, and recorded two positions of it, but did not recognize it, through not comparing his observations, which a pressure of occupation, and an impression that the discovery required a much more extensive search, prevented. But for this, and the non-publication of the Cambridge mathematician's results at the time they were forwarded to Sir George Airy in Oct., 1845, the honorable position of M. Leverrier would have been occupied by Mr. Adams, and that of M. Galle by Mr. Challis.

The century, however, has been chiefly remarkable for its laborious efforts to correct, systematize, and extend the results of former discoveries. Admirable and extensive catalogues of stars and double stars, and of nebulae, have been made; and optical and other instruments have been brought to what appears almost a state of perfection, Lord Rosse's reflecting telescope, with a speculum 6 ft. in diameter, being the triumph of modern mechanical and mathematical skill. In more recent years, research has been directed chiefly towards the physical nature of the sun and other heavenly bodies by means of spectrum-analysis. See SPECTRUM; SUN.

ASTRUC, JEAN, 1684-1766; a French physician. He had the anatomical chair in Toulouse, became professor after Chirac in Montpellier medical college, regent and professor of the faculty of medicine in Paris, and physician to the king. His attention was given chiefly to venereal and sexual diseases, in which he is regarded as excellent authority, his *De Morbis Veneretis Libri Sex* being known in most languages. He wrote also on diseases of women, and on obstetrics.

ASTUR. See FALCONIDÆ and GOSHAWK.

ASTURIAS, a northern province of Spain, bounded on the e. by Santander, on the s. by Leon, on the w. by Galicia, and on the n. by the bay of Biscay. The low hills of Leon and Old Castile rise gradually to the mountain-chain which forms the s. boundary, and towers to a height of about 11,000 ft. in the summit *Peña-de-Peñaranda*. The main road from Leon to Oviedo passes over the mountain-chain at Pajares. The northern slopes are broken by steep and dark valleys or chasms, which are among the wildest and most picturesque in Spain. The summits of the mountains are covered with snow even as late in the year as August. The climate is damp; clouds hang almost continually about the peaks, gathering to them the fogs of the Atlantic. From the mass of calcareous rock, marble crags rise from 200 to more than 400 ft. The principal kinds of wood are oak, chestnut, silver, and Scotch firs. Some of the forests in the remoter districts are very superb. Alpine pasturage decks the slopes, and a richer covering of green is found in the narrow valleys. In the wider valleys, the soil yields barley, wheat, maize, figs, olives, grapes, oranges. The coasts have good fisheries. The chief minerals of the province are copper, iron, lead, cobalt, arsenic, antimony, and coal. The pasturage of the higher valleys supports an excellent breed of horses, with numerous horned cattle.

A. was never firmly occupied by the Arabs, but afforded a place of refuge to the Goths in the 8th century. Here the famous Pelayo was made king in 718 A.D.; and his successors, after contending successfully against the Arabs, were made kings of Leon in the 10th century. The Asturian still boasts of his independence as a free hidalgo, and is simple in manners and brave, but less industrious and sociable than his neighbors in Biscay and Galicia. Many Asturians leave their province to seek a livelihood in other parts of Spain, and after saving money, return to dwell among their native hills and valleys. They have been termed the Swiss of Spain; and they are equally faithful and fond of money. Among them, the *Vagueros* form a distinct caste, intermarrying among themselves, and leading a nomadic course of life, spending the winter on the sea-coast, and the summer on the hills of Leytariegos. OVIEDO, the capital of A., has, since 1833, given its name to the whole province. The other considerable towns are the ports Gijon and Aviles. The whole area of A. includes 3686 sq.m., with a population of (1870) 610,883.

The eldest son of the Spanish king has the title of prince of A., professedly an imitation of the English prince of Wales, having been taken at the solicitation of the duke of Lancaster in 1388, when his daughter married the eldest son of Juan I.

ASTYAGES, the last king of Media, son and successor of Cyaxares, 595 B.C. Influenced by a dream, A. gave his daughter Nandane in marriage to Cambyzes, a Persian of eminence; and, again led by a dream which gave him alarm, he sent Harpagus to destroy the child which was the fruit of the marriage. But the child was hidden away by a shepherd, and it was after many years that his existence was brought to the notice of A., who easily discovered the boy's parentage. A. punished Harpagus for deceiving him, and Harpagus instigated Cyrus (the child now grown up) to lead a revolt, through which A. was made prisoner, and Cyrus took the scepter. A. was treated mildly, but kept a prisoner until his death.

ASUAY, ASSUAY, or AZUAY, a department of Ecuador, being all of the s. and e. portion of the republic, on the e. slope of the Andes, between 5° s. and 1° n., and 68° to

80° w.; about 120,000 sq.m.; pop. 248,459. There is a large desert in the west, but the eastern part is fertile, being watered by several affluents of the Amazon. The chief employments are cattle breeding, agriculture, and the gathering of cinchona bark. Loja and Cuenca are the chief towns.

**ASUNCION**, NUESTRA SEÑORA DE LA, or ASSUMPTION, the capital of Paraguay, 25° 16' s., 53° 43' w., on the e. bank of the Paraguay river; pop. 57, with suburbs, 48,000. The city was founded in 1536, and for more than a century was the capital of all the Spanish territory along the Rio de la Plata. The streets are unpaved, and sidewalks are rare. The houses are chiefly of a single story, and but a few have tiled roofs, the greater number being little better than huts of skeleton bamboo, plastered with mud. There are a cathedral and two or three other churches, from one of which the bones of Dr. Francia, the celebrated dictator, were stolen and taken no one knows whither. The city hall is a tolerable edifice; the government residence is of but one story. There are a quay, an arsenal, and workshops for ship repairing. The place is intensely warm in summer, but not especially unhealthy. In the suburbs are some fine residences; and recently cemeteries have been provided for the dead, hitherto buried under the city churches. A. has railway connection with Axul southward, and with Mercedes and Chivilcoy westward, and a large commerce with the provinces along the Paraguay and Uruguay rivers.

**ASYLUM**, a place of refuge. In ancient times, sacred places, especially the temples and altars of the gods, were appointed as asylums to which criminals, as well as persecuted individuals, might flee for refuge; and to molest them in such places was regarded as an impiety. An analogous institution is found in the laws of the Jews as described in the 35th chapter of Numbers, where six "cities of refuge" are appointed for persons guilty of manslaughter. Among the Greeks in early times, these asylums might be sometimes useful in preventing hasty retribution; but in the course of time they were so much abused that their sanctity was in a great measure disregarded. Thus Pausanias, who fled to the altar of Minerva, was taken and slain there by the Lacedæmonians, and in other cases the refugee was compelled to leave the A. by fire or starvation. In Rome, the emperor Tiberius abolished all such places of refuge from law, excepting those in the temples of Juno and Æsculapius. The custom of allowing to real or supposed criminals a place of safety in temples, was also adopted by the Christian church. In the time of Constantine the great, the churches were made asylums; and Theodosius II. extended the privilege to all courts, alleys, gardens, and houses belonging to the church. In 681 A.D., the synod of Toledo extended the privilege of A. to a space of 30 paces around every church. In the lawless periods of the middle ages, the influence of the church often prevented deeds of gross injustice and violence; but the sanctity of churches was abused by criminals; and this led to several modifications which gradually destroyed the privilege of sanctuary (q.v.). In England, it was abolished by acts passed in 1534 and 1697. The word A. is now applied to places of shelter for unfortunate or destitute persons, and especially to hospitals for the insane. See LUNACY.

**ASYMPTOTE** (Gr. not coinciding), a line that approaches nearer and nearer to some curve without ever meeting it. An example of an A. will be seen under HYPERBOLA.

As another illustration, let AB be a straight line which can be produced to any length towards B. Take any point, C, without the line, and draw a perpendicular reaching to any distance, D, beyond the line; set off any equal distances, E—1, 1—2, 2—3, etc., along AB; and draw C1d, C2d', C3d'', etc., making 1d, 2d', 3d'', etc., equal to ED. Now, it is evident that each of the points d, d', etc., is nearer to the line AB than the one to the left of it; if, therefore, a curve is traced through these points (the curve is called the *conchoïd*), it must continually approach the line AB. On the other hand, it is evident that the curve can never meet AB; for a line drawn from C to any point in AB, however distant that point, must, when produced cross AB. AB is thus an A. to the curve. To the senses, indeed, the curve and line soon become one, because all physical or sensible lines have breadth. It is only with regard to *mathematical* lines (see LINE) that the proposition is true; and the truth of it has to be conceived by an effort of pure reason, for it cannot be represented.

Asymptote.

ATACAMA, a department in s.w. Bolivia on the Pacific; 70,181 sq.m.; pop. 5273. It is mostly a barren, sandy desert, entirely uninhabitable; but in the n. part there are fertile valleys. The minerals are gold, silver, copper, and iron; and sulphate of soda, alum, and salt are common. Cobiya is the chief town, on the Pacific, about 22° s. lat. Northward in the province is the volcano Atacama, 18,000 ft. high.

ATACAMA, a province in n. Chili; a narrow strip between the Andes and the Pacific, s. of Bolivia; 41,120 sq.m.; pop. 75,72,446. The copper and silver mines are the richest known; of silver there are about 250, and of copper nearly 1000 mines. Since the dis-

covery of silver by the shepherd Juan Godoy, in 1832, the product has been considerably over \$100,000,000. The town of Chañarcillo is on the site of the silver discovery, 51 m. s. e. of Copiapo, the capital of the province, with railway connection. The first railway built in South America connects the capital with Caldera, the best ocean port of Chili.

**ATACAMITE**, an ore of copper, found as a crust on the lavas of Vesuvius and Etna, especially on those of Vesuvius erupted in the years 97, 1804, 1820, and 1822. It occurs abundantly in some parts of South America, as at Atacama in Peru, from which it derives its name; at Remolinos, Santa Rosa, and other districts in Chili; and at Sarapaca in Bolivia, where it is associated in veins with ores of silver. The natural varieties of A. are crystallized, massive, and pulverulent or granular. The massive or compact variety is usually reniform, with a fibrous structure. The crystals are short and needle-shaped; the primary form is a rhombic prism. It has been sometimes described as a chloride of copper, but incorrectly; and sometimes as a hydrochlorate (muriate) of copper; it is rather to be regarded as a combination of protoxide of copper with chloride of copper. It is a rich and productive ore, containing about 55 to 60 per cent of copper. The percentage composition of various specimens of A. is as follows:

	Copper protoxide.	Muriatic acid.	Water.	Total.
Compact atacamite .....	72.0	16.3	11.7	100
" " .....	76.5	11.0	12.5	100
Sandy atacamite.....	70.5	11.5	18.0	100
Crystallized atacamite. ....	73.0	16.2	10.8	100

A. often forms on the surface of copper exposed to the air or sea-water; and the greenish incrustation observed on antique bronze utensils, weapons, and other articles, and commonly known as the *æruge nobilis*, is composed of this salt. On some antique bronzes from Egypt the A. is crystalline. Atacamite is worked in South America as an ore of copper; and considerable quantities are sent to England to have the metal extracted therefrom. See COPPER.

**ATAHUALPA**, the favorite son of Huayna Capac, Inca of Peru, who died in 1525, about seven years before Pizarro's arrival in Peru. The mother of A. not being of the pure Inca blood, her son was formally excluded from inheriting the throne; but his handsome figure, bold spirit, and quick intelligence so won upon the affections of his father, that, on his death-bed he declared it to be his will that A. should receive as his portion the ancient kingdom of Quito (recently conquered), while Huascar, his eldest son, should possess Peru. For five years the brothers lived on terms of real or apparent friendship; but at length the restless ambition of A., who was constantly aspiring to new conquests, excited the uneasiness of Huascar, who, in an evil hour, was induced to send an envoy to his brother, with instructions to require him to render homage for his kingdom of Quito. A. fired at the proposal, and war was instantly declared. Placing himself at the head of the army of veterans which his father had left him, he invaded Peru, and in the spring of 1532 completely defeated Huascar on the plains of Quipaypan, in the neighborhood of Cuzco, the native Peruvian metropolis, only a few months before the arrival of the Spaniards. Huascar was taken prisoner, and confined in the strong fortress of Xauxa. Then followed, according to Garcilasso de la Vega, a series of atrocious massacres of all in whose veins ran the blood of the Incas; but his statements are so monstrous, and possess so little congruity, that they are rejected by Prescott as intrinsically incredible. In the mean time, the Spaniards had disembarked at Tumbez; and after a long, brave, and perilous march through the unknown country, Pizarro, at the head of his 300 cavaliers, approached the victorious camp of A., where he found some 50,000 men assembled. By a daring but diabolical stratagem, Pizarro obtained possession of the person of the king, who had come to visit him in a friendly spirit. While a priest was explaining the Christian religion, and the power of the pope over all the kingdoms of the earth, and how the pope had presented Peru to the Spanish monarch, in whose name they had come, A., indignantly interrupting him, told him that the pope (whoever he was) must be a crazy fool to talk of giving away countries which were not his own. When he inquired on what authority such claims were made, the priest pointed to the Bible, on which A. dashed the book on the ground, and the fields began to fill with Indians. The moment was critical. The crime which Pizarro had resolved upon the night before must be executed then or never. He waved a white scarf, which was the signal agreed upon. The mysterious artillery poured sudden death into the terrified masses of Peruvians, while the Spanish cavalry rode them down with merciless fury. Confusion seized the natives; they submitted—being unarmed—to this horrible butchery, only anxious to save their sacred Inca; but all their efforts to accomplish this proved unavailing, and after exhausting hours in the miserable work of murder, the inhuman Spaniards succeeded in capturing him. A. was treated with a great show of kindness at first, and more especially when he offered, as a ransom, "not merely to cover the floor, but to fill the room in which he stood with gold as high as he could reach." When A.'s brother, Huascar, who was still a prisoner, heard of this, he offered still more advantageous terms for himself. To prevent this, A. had him secretly assassinated. The golden treasure which was to constitute the ransom of A. now began to pour in, and at length A. demanded his freedom. This Pizarro refused to grant, and

accused A. of plotting against him. The result, after much base treachery on the part of the Spaniard, was a mock-trial, in which A. was condemned to be burned. On the 29th of Aug., 1533, he was led to the stake, but on agreeing to be "baptized," his sentence was commuted to death by strangulation.

**ATALANTA**, a mythical personage, the daughter of Jasus and Clymene, was born in Arcadia, and celebrated as a huntress, well skilled in the use of the bow and arrow. Her father, who had wished a son, exposed her, while an infant, on Mt. Parthenios, where she was found near the entrance of a cave by hunters, who are said to have brought her up, and afterwards restored her to her parents. While living as a wild mountain-maiden, she slew the centaurs Rhæcus and Hylæus. Afterwards, she sailed with the Argonauts (q.v.) to Colchis, and took a prominent part in the chase of the Calydonian boar (q.v.). She had many suitors, but was merciless in the conditions which she imposed on them. Being the swiftest of mortals, she offered to become the wife of him that should outstrip her—the penalty of defeat being death. At length she was conquered by a trick of one Meilanion, whom she was compelled to marry. He obtained from Venus a gift of three golden apples, which he successively dropped in the race; and A. was so charmed by their beauty, that she could not refrain from stooping to gather them, and so lost.—Mention is made of another A. in Greek antiquity, to whom a different parentage is assigned, but regarding whom the myth is essentially the same.

**ATARAIPTU**, a term signifying *devil's rock*. It is applied to one of the most singular eminences in the world, a granite pyramid in British Guiana, which rises abruptly from the plain about 900 ft., wooded for rather more than one third of the height, but bare thence to the peaked summit.

**ATASCO'SA**, a co. in s. Texas on the upper branches of the Nueces; 1262 sq.m.; pop. '70, 2915. The climate is good, soil sandy and easily cultivated, but stock-raising is the main business. Co. seat, Pleasanton.

**ATAULPHUS**, **ATAULF**, or **ADOLF**, the brother-in-law of Alaric, and his successor as king of the Visigoths. He assisted Alaric in the siege of Rome, and after A.'s death went to Gaul, taking as a captive Placidia, sister of the Roman emperor Honorius; and she afterwards became his wife. Jornandes says A. took Rome a second time, carried off Placidia, and made a treaty with Honorius which was solemnized by the marriage with Placidia in the forum; that A. was a faithful ally of Rome in Gaul, and went to Spain to suppress insurrections of the Vandals, where, according to others, he was assassinated.

**ATAVISM**, in physiology, the resemblance of a man or other animal to a remote progenitor, as a man who resembles his great-grandfather and not the intermediate parents. Watson, in a lecture on the practice of medicine, cited this case: A deaf-mute married a woman whose hearing was normal; they had two children; a deaf-mute son who left no children, and a daughter with perfect hearing, who married a man with perfect hearing, and became the mother of two deaf-mute daughters and a hearing son; this son married a woman with perfect hearing, and by her had a deaf-mute son; one of the daughters married a deaf-mute and bore a son whose hearing was perfect. There are some diseases of hereditary nature that lie dormant for two or three generations and then develop, such as insanity and consumption. Darwin uses reversion as nearly synonymous with A., to denote not merely the recurrences of long lapsed physical traits, but even the returning to a remote variety of species. Domestic animals running wild will gradually lose their civilized development and become like wild animals of their species. All the wild horses in America are from stock imported from the old world, yet they are nearly of one color, size, and form. Darwin, looking further back, suggests that the occasional appearance of a striped horse or mule indicates descent from some equine genus long ago extinct.

**ATAXY LOCOMOTOR**, a nervous disease showing itself in disordered movements of the limbs of locomotion. It is not paralysis, but loss of power to order harmoniously the muscles that move the body and maintain equilibrium. It begins insidiously and grows slowly. The earlier symptoms are disorder of vision, uneasiness in the back, with shooting pains through the limbs; increasing or perverted sensibility, and disturbance in the genito-urinary functions. Later, the victim feels that his walking is not firm and sure; that there is some soft substance between his feet and the ground; he walks with difficulty, and with short and hurried steps; each leg is lifted well up, but as he moves it forward, it is thrown out from him and the heel descends with force while the sole comes awkwardly after it. He now requires the aid of vision to walk at all, and looks steadily at his feet or at a point a little in front of them, and he cannot make a sudden turn without great risk of falling. If he stand erect with his feet together or nearly so, and take his eyes off them, he begins to totter and would fall if not supported. These phenomena are not the result of weakness of motor power, but only of defective muscular co-ordination. Diminished sensibility in the feet and legs is usual in this disease. The upper limbs are sometimes affected, so that though the hands retain all their natural muscular power, the sufferer cannot unfasten a button, or pick up a pin, or feed himself. At later stages the disease renders walking impossi-

ble, the legs moving loosely about, and the control of the sight upon the feet ceasing. Then the patient takes to his bed, the pains and jerking of the limbs increase, the motor power is quite gone, and he sinks under complete exhaustion or some intercurrent disease. Although usually going to a fatal termination, the disease is sometimes arrested, and appears to be quite conquered, particularly in its earlier stages. In most cases it extends over several years. A. L. arises from disease of a portion of the spinal cord, viz.: the posterior columns and the posterior nerve roots, which become atrophied and indurated. The exciting causes are not well understood, but exposure to cold, over exertion, privation, intemperance, and mental anxiety have been suggested as probable. It is sometimes hereditary, and is more common among males than females. It is developed usually not till middle life, from the age of 30 to 50. Beyond alleviation of pain little can be done by medicine, though many remedies have been tried. Electricity has been recommended by eminent authorities. Perhaps the best course is to attend carefully to the general health and regimen.

ATBARA, or BAHR-EL-ASWAD. See NILE, *ante*.

ATCHAFALAYA, a branch of the Mississippi at its delta. It forms so large an angle with the main river, that, after a course of only 130 m., it enters the gulf of Mexico, 120 m. to the w. of New Orleans. From the Red river, which enters the Mississippi just above its own point of departure, the A. had received so much driftwood, as formed at last a stationary raft 10 m. long, 230 yds. broad, and 18 ft. deep—an obstacle to navigation which the state of Louisiana required 4 years to remove.

ATCHAFALAYA BAYOU, an outlet of Red river in Louisiana, connecting also with the Mississippi and flowing southward to the gulf of Mexico. It is about 225 m. long, and navigable for steamers.

ATCHEEN, a kingdom forming the n.w. part of Sumatra; area, 2260 sq.m.; pop. 500,000; in 95° 20' to 97° 40' e. long., and 2° 50' to 5° 40' n. lat. The interior is mountainous—Abong Abong, 11,000 ft.; Loose, 11,000; the Golden mountain, 6460; Batu Gapit, 6155; Tampat Tuan, 4020. The natives are well made, industrious, intelligent, treacherous. In 1873, the Dutch declared war, and though at first repulsed, may now be said to have conquered the country. A., the capital, lies on both sides of the river in 5° 35' n. lat., and 95° 26' e. long., in a large valley formed by ranges of hill, of which the Golden mountain is the highest. Pop. 36,000. They barter for opium with Penang and Singapore, pepper, edible nests, gold-dust, camphor, benzoin, sulphur, satin-wood, betelnuts, etc.

ATCHEVEMENT is a term nearly equivalent to armorial bearings, and is often used when speaking of the arms of a deceased person as displayed at his funeral or elsewhere. In this sense it is more commonly used in its abbreviated form of hatchment (q.v.).

ATCHISON, a co. in n.e. Kansas on the Missouri border; 424 sq.m.; pop. 78,20,600. Agriculture is the main occupation. The central branch of the Union Pacific railroad intersects. Co. seat, Atchison.

ATCHISON, a co. in n.w. Missouri between the Missouri and Nodaway rivers; crossed by the Kansas City, St. Joseph and Council Bluffs railroad; 675 sq.m.; pop. '70, 8440. Agriculture is the only business. Co. seat, Rockford.

ATCHISON, a city of Kansas, seat of justice of Atchison co., on the Missouri, 25 m. from Leavenworth; pop. '75, 12,146. It is one of the great railroad centers of the country, being the terminus of the Missouri Pacific, of a branch of the Chicago, Rock Island and Pacific, of the Atchison and Nebraska, of the central branch of the Union Pacific, and of the Atchison, Topeka and Santa Fe. It is a rapidly growing city, with a great variety of manufactures.

ATCHISON, DAVID R., b. Ky., 1807. He was in the Missouri legislature in 1834, and a county judge in 1841, but was immediately chosen to the U. S. senate, where he at first opposed, and finally advocated, the right to hold slaves in the territories. He advocated the repeal of the Missouri compromise, and became the especial champion of those who were determined to force slavery into Kansas. Defeated in this purpose, A. retired to private life.

ATE, according to Homer, the daughter of Jupiter—or of Eris, as Hesiod says—was a vengeful goddess, ever attending *dysnomia*, or transgression of law, though she herself prompted men to such. She was banished from Olympus by Jove, whom she had incited to take an oath of which he subsequently repented. She then traveled to and fro over the earth with great rapidity, always intent on exercising a pernicious influence on mankind. But her steps were followed by the goddesses *Lilai* (prayers), benevolent daughters of Jove, who healed those who had been afflicted by A. The tragic writers describe A. as the goddess of retribution. Their representations almost identify her with NEMESIS and ERINNYA.

ATELES (Gr. incomplete), a genus of American monkeys, of the division with long prehensile tails, to which the name SAPAJOU (q.v.) is sometimes collectively applied. In the genus A., the head is round, and the facial angle about 60°; the limbs are

remarkably long and slender, upon which account the English name SPIDER MONKEY (q.v.) is sometimes used as a generic designation; and the forelimbs are either entirely destitute of a thumb, or have a mere rudimentary one, a peculiarity in allusion to which the name A. was given. The name coaita or quata is frequently given to some of the species of A., but is sometimes limited to *A. paniscus*, as spider monkey sometimes is to *A. arachnoides*. One of the best known species is the marimonda (*A. belzebub*), a common monkey of Guiana, and which occurs in immense numbers on the banks of the Orinoco.

**ATELIERS NATIONAUX**, or NATIONAL WORKSHOPS, a term under which such institutions became renowned in connection with the French revolution of 1848. In almost all countries and ages, there have been projects for organizing labor under public authority, designed generally for the benevolent purpose of obviating the distress caused by casual depressions in trade. However distinctly the laws of political economy were laid down on the point, it could always be said that these were merely theoretic, and therefore this one instance of practical experiment, however calamitous in its day, left behind it a valuable lesson. The principles of political economy on this matter are that competition only can fix the extent to which labor is required in any department, and the rate at which it must be remunerated; that it is this competition which gives the workman a stimulus to labor effectively and profitably; and that if this stimulus were withdrawn, and all were paid alike, whether they worked well or ill, all would work ill, the public would be losers, and the large fund out of which laborers are supported under the competitive system would cease to exist. Immediately on the formation of the provisional government in Feb., 1848, a permanent department was established, called *The Committee of the Government for the Workmen*. This establishment acted on the doctrine that all workmen were entitled to have a living provided for them on a certain uniform scale. They did not forcibly abolish private employment, but they held out inducements which made workmen leave and employers break up the existing establishments. Consequently, nearly all the Parisian workmen threw themselves on the government, and others flocked in from other quarters in alarming numbers. It was found that these crowds of men, who claimed the privilege of employment by the state, had very little idea of the duty of working, even were there distinct employment for them. But when the body had increased to considerably above a hundred thousand, the government found that they had this ever-increasing mass to feed, and nothing to feed them with, since trade thus meddled with was in reality ruined. It was consequently found necessary to put an end to the system, and the result was the bloody battle of Paris, which brought about the restoration of despotism. One incidental experiment will perhaps best explain the ruinous tendency of the whole system. In the Hôtel Clichy, 1500 tailors were assembled to make uniforms for the new *garde mobile*. The men were to receive among them for the completed work as much as an army-contractor would have demanded. In the meantime they were paid two francs a day of subsistence money; the rest was to be divided among them at the end. The men were buoyed up with the notion that they were to receive not only their own proper wages, but the indefinite and enormous sum which they supposed to form the profit of the contractor, forgetting that such profit seldom exceeds about three per cent. Their disappointment was great when they found nothing to divide. There was, in fact, a loss. When paid their two francs—not much more than half what they obtained when employed by a contractor—they were paid more than the value of their labor and the profit of the transaction to boot. The reason is pretty obvious. Each man working for himself, and paid for his work on the competitive system, exerted himself; but when one man's exertions went virtually for nothing, unless he got the 1499 others to exert themselves to the same amount, all were alike lazy.

**ATELLANÆ**, *Fabule Atellanæ* (also styled *Ludi Osci*), a kind of popular drama in Rome, first introduced from Atella, a t. in Campania, between Capua and Naples. After the Greek drama had been brought to Rome by Livius Andronicus, the old *Fabule Atellanæ* were still retained as interludes and after-pieces. They are not to be confounded with the Greek satiric drama, although the character of both was to some extent the same. In the latter, satyrs figured; while the former personated real Oscan characters. The *Macchus* and *Bucco* of the *Fabule Atellanæ* may be considered the origin of the modern Italian arlecchino (harlequin), and other characters of the same stamp. They were the favorite characters; spoke the Oscan dialect, and excited laughter by its quaint old-fashioned words and phrases. The A. were neither so dignified as the *comædia prætertata*, nor so low as the *comædia tabernaria*, but indulged in a kind of genial and decent drollery. The caricature was at first always pleasant, and, though quizzical, it did not lapse into obscenity, like the *mimi*. Respectable Roman youths, who could not appear as actors in the regular Greek drama without losing *caste*, were allowed to take part in the A. A few fragments in these popular farces have been collected by Bothe in his *Pæctarum Latinorum Scenicorum Fragmenta* (Leip., 1834). See also Munk, *De Fabulis Atellanis* (Leip., 1840).

**A TEMPO** (Ital.), in time. A term used to denote that, after some short relaxation in the time, the performer must return to the original degree of movement.

**A TEMPO GIUSTO** (Ital.), in correct time. A term used to denote that, after a recitative, the performer should keep the music true and correct, which, during the recitative, had been altered to suit the action and passion of the scene.

**A'TESEGA** (the place of fire), a spot on the peninsula of Apsheron, on the w. coast of the Caspian sea. It is considered sacred by the Guebres, or Persian fire worshippers, who visit it in large numbers, and bow before the holy flames which issue from the bituminous soil. It is about a mile in diameter, and from its center, in clear dry weather, creeps forth a blue flame (caused by the ignition of the naphtha), which shines with great brightness by night.

**ATESSA**, a t. of south Italy, in the province of Chieti, and 23 m. s.s.e. from Chieti. It has a beautiful collegiate church, and several other churches and convents. Pop. '71, 5197.

**ATEUCHEUS**. See **BEETLE** and **SCARABÆUS**.

**ATH**, or **AATH**, a strongly fortified t. in the province of Hainault, Belgium, situated on the Dender, in lat. 50° 36' n., long. 3° 48' e. It has an arsenal, hospital, and college, and important manufactures of linen, calicoes, lace, gloves, cutlery, large hammers, etc., and carries on a brisk trade. Pop. 8260. The ancient church of St. Julien in A. is noted for its extraordinarily high tower. The town has been several times besieged and taken: in 1697, by Catinat and Vauban; in 1706, by the allied forces under the Dutch gen. Owerkerke; in 1745, by the French after a short siege; and in 1792, by the forces of the republic under Berneron.

**ATHABASCA**, a river and lake in the n.w. of America, forming part of the great basin of the Mackenzie, and lying, therefore, in the n.w. territory of the Canadian dominion. The river rises in the Rocky mountains near Mt. Brown, the highest point in the range. Its actual source is the small lake, already mentioned under the head of AMERICA as the Committee's Punch Bowl, which sends its tribute at once through the A. to the Frozen ocean, and through the Columbia to the Pacific. Its general course is n.e., till, after passing through A. lake, or rather crossing its w. end, it turns towards the n.w., and after a course of 30 or 40 m., unites with the Peace river, from beyond the Rocky mountains, to form the Slave river, which, again, after passing through Great Slave lake, takes the name of the Mackenzie.—*Lake A.* receives nearly all its waters from the A. river, and is probably unique in this, that its principal feeder traverses not its length but its breadth, and that not in its middle, but at its extremity. The lake's single outlet is the river A. The lat. is about 55° n., and the long. between 103° and 116° w., the length 230 m., and the average width 20.

**ATHABASCAS**, Indians of British North America along the Arctic ocean and from Hudson's bay westward to the Pacific. There are several tribes, of whom the best known are the Umpquas, the Timnes, the Dog Ribs, and the Beavers. It is thought that there are from 30,000 to 32,000 of them. They are peaceable and to some extent industrious. There are other A. Indians on the Mexican border from Texas to California, among them the savage and warlike Apaches, and their opposites, the quiet Navajoes and the Lipans. These tribes are about 17,000 in all. They say that their ancestors came from the west over seas and islands of snow and ice; possibly a glimmering of a Tartar origin. They are larger and have more beard than other Indians.

**ATHA-BEN-HAKEM**, or **ALHAKEM-IBN-ATTA**. See **MOHAMMEDAN SECTS**, *ante*.

**ATHALIAH**, the daughter of Ahab, king of Israel, married Jehoram, king of Judah, who d. 885 B.C. After the death of her son Ahaziah, who succeeded him, but reigned for only one year, she paved her own way to the throne by putting to death (as she supposed) all the seed-royal. "But Jehosheba, the daughter of king Jehoram, sister of Ahaziah, took Joash, the son of Ahaziah, and stole him from among the king's sons, who were slain." The young prince thus rescued was privately educated in the temple, and, after A. had reigned six years, the high-priest Jehoiada placed Joash on the throne (878 B.C.). A., hearing the noise attending the coronation, hastened to the temple, where the people were shouting, "God save the king!" As she looked round in astonishment on the young king, whom she had supposed to be dead, surrounded by priests, Levites, rulers, captains, and a rejoicing multitude, she "rent her clothes, and cried, 'Treason! treason!'" By the command of the high-priest, she was led out of the temple, and slain in the gateway of the palace. The house of Baal, with its altars and images, was broken down. This narrative (2 Kings xi.; 2 Chron. xxi. 6, xxii. 10-12, xxiii.) is the subject of Racine's drama, *Athalie*.

**ATHA-NARIC**, a king of the western Goths, whose settlements lay on the n. bank of the lower Danube, in the 4th century. Having taken advantage of the weakness of the Roman empire when the imperial armies were engaged in suppressing the rebellion of Procopius, war was declared against him by the emperor Valens. A. acted strictly on the defensive during two campaigns, in which the Romans gained no advantage over him; but in the third year of the war (369 A.D.), he hazarded a general battle, and was defeated, whereupon he sued for peace, and, with that object, had a conference with Valens in a boat on the Danube. Peace was concluded, and A. had his attention occupied in settling dissensions arising out of the Arian controversy which then agitated his people, when

the first advance of the Huns on Europe alarmed the Gothic nation. A. attempted to secure the eastern borders of his kingdom; but the Huns forced the passages of the Dnieper, defeated the Goths, and advanced in great force into the plains of Dacia. When, in 374, the western Goths were received by the Romans as allies, and had settlements granted them on the s. of the Danube, A., with a part of his people, refused to accompany them, removing to the west, and fortifying himself against the new enemy. In 380, however, he was obliged to retire, when he accepted the hospitality of the empire, and removed to Constantinople, where he met with a cordial and honorable reception by the emperor Theodosius. At this time died Fritigern, the king of the Goths that had settled on the s. of the Danube; and A. being made king of the whole western Gothic nation, concluded a treaty of peace, in behalf of the whole, which had the effect of incorporating that people with the other subjects of the empire. He d. at Constantinople in 381.

**ATHANASIAN CREED**, the third of the three ecumenical symbols, derived its name from its composition being attributed to Athanasius; it is also known, from its initial words in Latin, as the creed *Quicumque Vult*. The first part of this creed contains a detailed exposition of the Trinity; the second, the doctrine of the incarnation. Modern criticism has called in question the title of Athanasius to be considered the author of this creed. It was known as early as the beginning of the 6th c., but not under its present name. It is spoken of as "Athanasius's Tract on the Trinity," in some articles of the middle of the 8th c., and is supposed to be alluded to, "as the faith of the holy prelate Athanasius, in the council of Autun, about 670. Athanasius himself makes no mention of this creed, although its doctrines are essentially his; nor do any of the church fathers. Other two circumstances speak against its authenticity: it is in Latin, and Athanasius wrote in Greek; the expressions, again, are different from those used by Athanasius in speaking of the same things. By Protestants, therefore, and even by most Catholics, its Athanasian origin has been given up, and its production has been assigned with most probability to the 5th c., and to Gaul; Hilary, archbishop of Arles (about 430), being conjectured to be the author. The title of Athanasian probably became attached to it during the Arian controversy in Gaul, as being an exposition of the system of doctrine which was opposed to the Arian system, and which would naturally be called Athanasian from its chief propounder. It was received into the public offices of the Gallic church in the 7th c., and by the middle of the 10th c. it was adopted at Rome and all over the west. In Britain, it was probably in use as early as 800. The Greek church was late in receiving it, and even then not without altering the article concerning the "Procession of the Holy Ghost." The reformers adhered to the A. C., and Luther called it "a bulwark of the apostles' creed." Even those churches that do not in any way acknowledge it as a symbol (as the Presbyterian churches of Britain and America, as well as the independents) generally accept its doctrines.

The A. C. is the most rigid and intolerant of the three Catholic symbols, and has given rise to much controversy; and though still generally received by Protestants as well as Catholics, the regard once had for it has declined. The points in this creed that give offense to some are defended by others, on the plea that it was not drawn up for the sake of gratuitously dogmatizing on abstruse speculative truths, but to counteract other dogmas which were held to be dangerously heretical. Waterland, in his *Critical History of the Athanasian Creed*, says: "The use of it will hardly be thought superfluous so long as there are any Arians, Photinians, Sabellians, Macedonians, Apollinarians, Nestorians, or Eutychians in these parts." (See articles under these heads.) With respect to what are called the "damatory clauses" (the clauses, namely: "Which faith except every one do keep whole and undefiled, without doubt he shall perish everlastingly;" and: "This is the Catholic faith, which except a man believe faithfully, he cannot be saved"), the churches which adopt the creed do not mean by them to imprecate curses, but to declare, as a logical sequence of a true faith being necessary to salvation, that those who do not hold the true faith are in danger of perishing; as it is said, Mark xvi. 16, "He that believeth not shall be damned." These clauses are also held to apply to those who deny the substance of the Christian religion, and not infallibly to every person who may be in error as to any one particular article. A rubric to this effect was drawn up by the commissioners appointed in 1689 for the review of the English common prayer-book, but none of their suggestions took effect. Compare also the 18th article of the church of England with these clauses.

**ATHANASIUS**, primate of Egypt, was b. in Alexandria about the year 296 A.D. There are no particulars on record of his lineage or his parents. Alexander, then officiating as primate or patriarch of Alexandria, brought him up in his own family, and superintended his education, with the view of his entering on the Christian ministry. In his youth, he often visited the celebrated hermit St. Antony, and embraced for a time the ascetic life with the venerable recluse. He was but a youth and only a deacon when appointed a member of the first general council at Nice, in which he distinguished himself by his erudition and his eloquence.

His patron, Alexander, having died in the following year, he was duly elected to the primacy by the clergy and people; and was but newly installed in his office, when Arius, who had been banished at the time of the condemnation of his doctrine at Nice, was recalled, and made a recantation of his erroneous principles. A., it is said, refused

on this occasion to comply with the will of the emperor that the heretic should be restored to communion. On this account, and in consequence of several other charges brought against him by the Arian party, he was summoned by the emperor Constantine to appear before the synod of Tyre, in 335 A.D., which deposed him from his office. His sentence was confirmed by the synod of Jerusalem in the following year, when he was banished to Treves. In 338, Constantius, now emperor of the east, though unfriendly to the principles of the Trinitarians, recalled A. from his banishment, and restored him to the primacy at Alexandria. His entrance into the city was like a triumphal procession; but the Arians soon rose against him, and (in 341) he was again condemned by a council of 90 Arian bishops assembled at Antioch. Against this decision a protest was made by 100 orthodox bishops at Alexandria; and in a council held at Sardis, 300 bishops, with Julius, bishop of Rome, at their head, confirmed the decision in favor of A., who was again replaced in his office (349 A.D.). The Arians once more acquired the ascendancy after Constantius (in 353) had been made emperor of both the east and the west; for in that year A. was condemned by a council held at Arles, and the sentence was confirmed by another held at Milan in 355, the influence of the sovereign being strongly exerted to secure his condemnation. As the resolute patriarch had declared that he would not leave his place without an express order from the emperor, violent means were resorted to for his expulsion. While engaged in conducting divine service, he was interrupted by a company of soldiers, from whom he made his escape into the Egyptian desert. A price was set on his head; and to avoid his persecutors, he retired from the usual haunts of the anchorites to a remote desert in upper Egypt, where he was attended by one faithful follower. Here he wrote several works to confirm orthodox Christians in their faith. On the accession of Julian to the imperial throne, toleration was proclaimed to all religions, and A. returned to his former position as patriarch of Alexandria (361 A.D.). His next controversy was with the heathen subjects of Julian, to whom the patriarch, by his zeal in opposing their religion, had made himself very offensive. To save his life he was compelled again to flee from Alexandria, and remained concealed in the Theban desert until 363, when Jovian ascended the throne. After holding office again as patriarch for only a short space of time, he was expelled anew by the Arians, under the emperor Valens. A. now found refuge in the tomb of his father, where he remained hidden four months, until Valens, moved by petitions from the orthodox Alexandrians, restored the patriarch to his see, in which he continued till his death in 373 A.D.

A. was the leading ecclesiastic in the most trying period of the history of the early Christian church. His ability, his conscientiousness, his judiciousness and wisdom, his fearlessness in the storms of opposition, his activity and patience, all mark him out as an ornament of the age, as well as the most influential public character in matters of religion. Though twenty years of his life were spent either in exile or what was equivalent to it, yet his prudence and steadfastness, combined with the support of a large party, crowned his exertions with complete success. He was a clear thinker, and as a speaker was distinguished for extemporaneous precision, force, and persuasiveness.

His writings are polemical, historical, and moral; all marked by a style simple, cogent, and clear. The polemical works treat chiefly of the doctrines of the Trinity, the incarnation of our Savior, and the divinity of the Holy Spirit.

The earliest edition of the collected works of A. in the original Greek appeared in two volumes, folio, at Heidelberg, in 1600. It was accompanied with a Latin translation. The most complete edition is that published at Padua in 1777. A.'s four orations against the Arians, and his oration against the Gentiles, were translated by S. Parker (Oxford, 1713); also his treatise on the incarnation of the word was translated by W. Whiston, forming part of that gentleman's *Collection of Ancient Monuments Relating to the Trinity and Incarnation*, London, in 1713. The epistles of A. in defense of the Nicene creed, and on the councils of Ariminum and Seleucia, together with his first oration against the Arians, were translated, with notes, by the Rev. John Henry Newman, Oxford, (1842).

**ATHEISM**, a word of modern formation, from Gr. *atheos*, "without God," signifies the doctrine of those who deny the existence of a God. The term atheist conveys such terrible associations to almost all minds, that there is perhaps no reproach from which men shrink more; and yet it has been freely applied by the zealous of all ages to those whose notions of the invisible powers differed from their own. The imputation is the most damaging that can be made, and it requires only a little ingenuity to make out a case of *constructive* A. from any set of opinions at all differing from the common. Thus, the ancient Greeks accused some of their philosophers of A. though they did not deny the existence of a divinity, but only rejected the common notions of a plurality of gods. And in the Christian church, after the doctrine of the Trinity had been fixed and defined, those that denied the divinity of Christ were not unusually branded as atheists.

The horror inspired by this name is strikingly shown in the way it is repudiated by the adherents of pantheism (q.v.), who reject a personal god, and substitute the idealized principle of order that pervades the universe. It is hardly to be denied, however, that the idea associated with the word God has hitherto involved personality as its very essence; and, except for the purpose of avoiding odium, there could be little propriety in retaining the word when the notion is so completely altered.

The view of those who, like Kant, believe it impossible to *demonstrate* satisfactorily the existence of God, though it must be held on other grounds, is called *speculative A.*, in opposition to the *dogmatic A.* of those who attempt to disprove that existence.

**ATH ELNEY**, ISLE OF, a marsh at the junction of the rivers Tone and Parret, in the middle of Somersetshire. Here Alfred, when driven from his throne, hid from his enemies, and founded, in 888, a Benedictine abbey, now entirely gone. Among the many relics found in this spot is a ring of Alfred's preserved in the Oxford museum. The name Athelney means "island of the nobles," or "royal island."

**ATHELSTAN**, the grandson of Alfred the great, was b. about 895 A.D., and was the first Saxon monarch who took the title of king of England, Alfred himself only assuming that of king of the Anglo-Saxons. He was crowned at Kingston-upon-Thames, in 925, and seems to have possessed both great ambition and high talent. It is supposed that his design was to unite in subjection to his single sway the entire island of Britain. His resources, however, were not equal to the undertaking, and he had to content himself with the acquisition of portions of Cornwall and Wales. On the death of Sigtric, king of Northumbria, who had married one of his daughters, A. took possession of his dominions. This excited the alarm and animosity of the neighboring states, and a league, composed of Welsh, Scotch, and Irish, was formed against the English king, for the purpose of placing Aulaff, the son of Sigtric, on his father's throne. A fierce and decisive battle was fought at Brunenburgh, in which the allies were utterly defeated, and which became famous in Saxon song. After this, the reputation of A. spread into the continent. His sisters were married into the royal families of France and Germany, and he himself enjoyed the greatest influence and consideration. At home, he exhibited a deep interest in the welfare of his people, improved the laws, built monasteries, and encouraged the translation of the Bible into the vernacular. He d. at Gloucester, on the 25th Oct., 941, in his 47th year.

**ATHENA**. See MINERVA, *ante*.

**ATHENEUM** (Gr. *Athenaion*), the temple of Minerva (Gr. *Athene*) at Athens, which was frequented by poets, learned men, and rhetoricians, who there read aloud their works.—The A. in Rome was a school or college erected, by the emperor Hadrian, for the study of poetry and rhetoric, with a regular staff of professors. It existed for a long period. In the time of Theodosius II., it had three professors of oratory, ten of grammar, five of sophistry or dialectics, one of philosophy, and two of jurisprudence.—In modern times, the name A. has been revived as an appellation for certain literary institutions, and also as a collective title for literary essays and reviews. A. is the title of two weekly journals of literature, science, and art—one published in London, the other in Paris.

**ATHENEUS**, a Greek *rhetor* and *littérateur*, b. at Naucratis in Egypt. He lived at the close of the 2d and beginning of the 3d century. His work, entitled *Deipnosophistae* (Banquet of the Learned), in fifteen books, but of which we possess the first two, and parts of the third, eleventh, and fifteenth only in an abridged form, is very interesting, as it has preserved for us copious fragments of old writers, and treats, in the form of dialogue, of almost all the topics of ancient Greek manners, private and public life, arts, sciences, etc. It is not a work indicative of any high ability; the author, for the most part, appears in the character of an agreeable, well-read, epicurean gentleman, excessively fond of *till-bits*, both of scandal and cookery. He tells many stories to the disadvantage of people whom history praises; but these we are by no means bound to believe, nor, indeed, is he a man whose opinions are worth much on any subject; but as a melange of literary, social, and domestic gossip, the value of the work is unrivaled. A. appears to have read enormously; he states that he had made extracts himself from 800 plays of the middle comedy alone. But his dialogue is prolix and lumbering; and his work is not irradiated by a single gleam of genius, and has only achieved immortality through being a store-house of miscellaneous information, that otherwise would have been lost to the race. The best editions are by Schweighäuser (14 vols., Strasb., 1801-7), and Dindorf (3 vols., Leip., 1827). There is an English translation of A. in "Bohn's Classical Library," (3 vols., Lond., 1854).

**ATHENAGORAS**, an early Christian philosopher, who taught first at Athens, and afterwards at Alexandria. He is one of the oldest of the apologetical writers, and is favorably known by his *Legatio pro Christianis*, which he addressed to the emperor Marcus Aurelius, in the year 177 A.D. He therein defended the Christians against the monstrous accusations of the heathen, viz.: that they were guilty of atheism, incest, and cannibalism. His work is written in a philosophical spirit, and is marked by great clearness and cogency of style. We likewise possess a valuable treatise of his on the resurrection of the dead.

**ATHENAIS**, an Athenian of distinguished beauty, the daughter of Leontinos the Sophist, was b. about the close of the 4th c. A.D. She received from her father a superior education, being skilled in Greek and Latin literature, rhetoric, astronomy, geometry, and the science of arithmetic. After his death, she repaired to Constantinople, to obtain justice for the harsh treatment to which her brother subjected her. Here her beauty and intelligence made her the favorite of Augusta Pulcheria, sister of Theodosius II., who considered that she would make an excellent wife for the emperor. An

421, A. having been baptized and named Eudocia, was married to Theodosius, and in 438, made a splendid pilgrimage to Jerusalem, bringing with her, on her return, the supposed relics of the first martyr, Stephen. Afterwards, she lost the favor of Pulcheria—the real manager of affairs—and was banished from the court. She then retired to Jerusalem, where she suffered many persecutions, and d., in the odor of sanctity, 460 A.D. A. wrote an epic poem on the war of Theodosius against the Persians, and several other metrical works which have not been preserved.

ATHENODORUS, surnamed CANANITES, or SANDONUS, a Stoic philosopher, who probably gave instruction to Augustus when he was at Apollonia, and who was made tutor to Tiberius, who esteemed him highly for virtue and probity. He was in the habit of giving his opinions freely, and often warned Augustus that when he found himself giving way to anger he should repeat the letters of the alphabet. He d. in Targus, his native t., aged 82. None of his works have survived. Another A., surnamed CORDILION, was librarian at Pergamus, and d. in Rome. There were also two sculptors of the name, one of whom assisted Agesander in the group of the "Laocoön."

ATHENS, the capital of the ancient state of Attica, is said to have been founded by Cecrops, about 1550 B.C., and styled Cecropia; but even the ancients themselves doubted this tradition. Equally uncertain is the story that it was first styled A., in honor of Athene, during the reign of Erichthonius. The ancient citadel was situated on the top of a square craggy rock, 150 ft. high, with a flat summit, 1000 ft. long, and 500 broad. Gradually, as population increased, A. extended itself over the wide and beautiful plain below. This increase is said to have been occasioned by the organization of the 12 Attic tribes into a political confederacy or union by Theseus, the brightest figure that shines through the "dark ages" of Attic history. The position of A. near the gulf of Saronica, opposite the eastern coast of the Peloponnesus, was favorable to the acquirement of naval power. The city, which was distant 4 or 5 m. from the sea, possessed three harbors, all situated on the s.w., and connected with it by walls. The oldest of these harbors was Phalerum. It was also the nearest to the city, and accessible at all times by a dry road. The Peiræus was first used as a harbor by Themistocles. Munychia was the acropolis of the whole rocky peninsula termed the Peiræus, and of immense importance strategically. The two last harbors were connected with the city by the famous "long walls," of which we read so much in Athenian history. They were 40 stadia, or nearly 5 m., in length. Two streams flowed in the vicinity of A.; on the e. side, the Ilissus, which also washed the southern part of the city; and on the w., the Cephissus, about a mile and a half beyond the walls. To the w. lay Salamis, with Eleusis on the n.w., Phlyke and Decellea on the n., Marathon on the n.e., and Hymettus on the s. All along the coast rose splendid buildings.

The whole of the magnificent prospect was crowned by the acropolis, where all the most glorious monuments of A. were assembled. First rose the parthenon (q.v.), or temple of Minerva, a pile which even now, after the lapse of centuries, remains among the wonders of the world. The propylæa, all built of white marble, formed the entrance to the parthenon. Close to it, on the n. side of the acropolis, rose the erechtheium, the most venerated of all Athenian sanctuaries, and connected with the oldest religious history of the city. The whole of it was destroyed by the Persians, but was restored during the Peloponnesian war. Its ruins still exist, and allow us to form a very correct idea of its external form and structure. In some points, it differed from all other examples of Greek temples. But it would be tedious and unprofitable to mention in detail all those magnificent buildings which were the glory of ancient Athens. It is sufficient to say that gods were never more superbly honored in any land. That enthusiastic love of the beautiful which animated the Athenians, turning their religion into an art, and making worship an education in æsthetics, is nowhere so clearly visible as in their religious architecture. Their mythological faith stood daily before their eyes in monumental splendor, for almost every deity had his temple or shrine in the city. Two of the finest buildings—the temple of Theseus, and that of Jupiter Olympus—were on the outside of the city; the first to the n.w., the second to the s. The former was both a temple and a tomb, inasmuch as it held the remains of Theseus himself. It was built about 465 B.C., and was therefore older than the parthenon. It had the privilege of an asylum for slaves, and the large space of ground which it inclosed was frequently used as a muster-ground for the Athenian soldiery. It was built of the favorite Pentelic marble, in the doric style of architecture, and is the best preserved of all the monuments of ancient Athens. For centuries it was a Christian church, appropriately enough dedicated to St. George, the chivalrous hero of the "dark ages" of Christianity, as Theseus had been of the "dark ages" of Attic history; but is now the national museum of the city. The temple of Jupiter, of which 16 grand Corinthian columns are still extant, to the s.e. of the acropolis, and near the right bank of the Ilissus, in size, splendor, and beauty excelled all other Athenian structures. Immense sums of money were expended upon it from the time when it was commenced by Peisistratus, until it was completed by Hadrian, a period of 700 years. The building of it was frequently suspended, so that Philostratus calls it "a struggle with time." At the time the Persians sacked the city, it was fortunately only beginning to be built, and so escaped destruction. Aristotle speaks of it as a work of despotic grandeur, and

equal to the pyramids of Egypt. The exterior was decorated by about 120 fluted columns, 61 ft. in height, and more than 6 ft. in diameter. It was 354 ft. long, and 171 broad, and contained the celebrated statue of the Olympian Jupiter in ivory and gold, the work of Phidias.

Besides these wonders of art, the city contained places of interest of which the memory will perpetually remain—the academy where Plato, whose estate lay near it, gave his lessons in a grove of plane-trees adorned with statues; tradition alleged it to have belonged originally to Academus. Hipparchus surrounded it with a wall, and Cimon adorned it with walks, fountains, and olive-groves. The lyceum, the most important of the Athenian gymnasia, where Aristotle lectured; and, near to this, the cynosarges, where Antisthenes the Cynic expounded his "harsh and crabbed" doctrine; the hill of the areopagus, where the most venerable court of judicature was held; and the prytaneum, or senate-house. About a quarter of a mile to the w. of the acropolis rises a low hill, which marks the locality of the pnyx, a place of public assembly, forming a large semicircular area, bounded at the base by a limestone wall, from which projects a pedestal, carved out of the rock, and ascended by steps. This most interesting place has been preserved almost in its integrity, and, as we look around, we are carried back to the times when some 6000 Athenian citizens were here assembled, when the orator, standing upon the pedestal, could survey the acropolis, with all its temples, the venerable areopagus, and beyond the city the extended plains and villages of Attica, with corn-fields, olive-grounds, and vineyards.

A., in its most flourishing period, numbered 21,000 free citizens; from which we may calculate that it contained about 200,000 inhabitants. More than 2000 years have passed over the beautiful city, and still its remains excite the admiration of the world. The Turks surrounded it with wide irregular walls, partly built out of the ruins of the old walls, and containing many fragments of noble columns. Of the propylæa, the right wing, or temple of victory, was destroyed in 1656 by the explosion of a powder magazine. Six columns, with lofty arches, remain to mark the site of the opposite wing. The interior of the parthenon was used for some time as a Turkish mosque. Eight columns remain on the e. of the front, several colonnades at the sides; and of the back pediment, where the combat of Minerva and Neptune was sculptured, nothing remains save the head of a sea-horse, and two decapitated female figures. Of the pediment in front, several figures belonging to the group representing the birth of Minerva are preserved in the British museum, and justly regarded as masterpieces of ancient sculpture. Of all the statues which the parthenon contained, only one, that of Hadrian, has been preserved. Ruined as it has been, the general aspect of the parthenon is still sublime. Of the erechtheum (or temple of Neptunus Erechtheus) considerable vestiges remain, especially the beautiful female figures styled caryatides.

The situations and vast extent of the two theaters may still be traced, though grain is now grown in the arenas. All these remains belong to the acropolis. In the city below, there are no such splendid memorials. The horologium, or octagonal temple of the winds (built by Andronicus Kyrrhestes), has been well preserved; but a few fragments found in broken walls are all that remain to tell of the splendid gymnasium built by Ptolemaeus. Beyond the city, the attention of the spectator is arrested by the sublime ruins of the temple of Jupiter Olympus. Pedestals and inscriptions have been found here and there, sometimes buried in the earth. The sculptures on the friezes of the interior of the temple of Theseus, representing the exploits of Theseus, have been well preserved, while the external sculptures are almost utterly destroyed. A Turkish burial-place now occupies the hill where the areopagus held its sittings. The site of the lyceum is indicated only by scattered stones, and a modern house and garden occupy the place of the academy. Scarcely anything remains to show the old magnificence of the harbors Peiræus, Phaleros, and Munychia.

It is probable that, in the time of Pausanias, many structures remained belonging to the period before the Persian war, as Xerxes, during his short time of mastery over A., would scarcely have been able to destroy more than the fortifications and principal public buildings. Themistocles, in his restoration of the city, had chiefly a regard to utility; Cimon paid attention to its decoration; but Pericles far exceeded them in the magnificence of his designs, which were too vast to be carried into effect in later times. The civilization, spreading from A. as its center, raised Macedon and other states into dangerous rivalry. The defeat at Charoncia was as fatal to the fine arts as to the liberty of the Athenians. After the works at the Peiræus had been destroyed by Sulla, the naval power, and with it the whole political importance of A., rapidly declined. It is true that the city was treated leniently by its conquerors; the temples and statues were preserved from violation, and A., with all the trophies of eight centuries of greatness, remained under the Antonines; but the free national spirit of the Athenians had departed forever, and slowly, but surely, the fine arts shared the fate of Grecian liberty. Their treasures, which had been spared by the Roman emperors, were gradually stolen away by various thievish collectors, especially for the decoration of Byzantium, or were destroyed by irreflective Christian zeal and barbarian invasion. About 420 A.D., the ancient religion and temple-service of A. had entirely disappeared; afterwards, the schools of philosophy were closed by Justinian, and Greek mythology was gradually forgotten. St. George took the place of Theseus, and the parthenon was converted into

a church. The surviving industry of A. was injured by Roger of Sicily, who removed its silk manufactures. In 1456, A. fell into the hands of Omar, and, to consummate its degradation, under the low, sensual Turks, the city of Athens was regarded as an appanage of the harem, and governed by a black eunuch. The Venetians, having captured the city in 1687, intended to carry away as a trophy the quadriga of victory from the w. front of the parthenon, but shattered it in their attempt to remove it. In 1688, A. was again delivered into the hands of the Turks, and the work of demolition now proceeded rapidly. The grand remains of antiquity were used as quarries to supply materials for all ordinary buildings, and, in the course of another century, the city was reduced to its lowest point of degradation.

Modern A. (styled by the Turks *Athina* or *Setines*) is now the capital of the new kingdom of Greece. Previous to the Greek revolution (1821), it was a provincial city of inferior importance, the seat of a Greek metropolitan bishop, and under the jurisdiction of the Turkish governor in Eubœa. In 1821, the war of liberation commenced, and the Turks surrendered Athens in the following year; but again captured it in 1826, and took the acropolis in 1827. After this it was left in ruins until 1830, when Attica was declared united with Greece by the protocol of the London conference. In 1834, Otho, the son of the Bavarian monarch, who had been elected to the sovereignty of the new kingdom, removed his residence from Nauplia to A. Improvements now proceeded rapidly: Turkish manners and customs disappeared; the contemptible wooden houses and crooked streets were superseded by new ones—among which the *Hermes*, *Æolus*, *Athene*, and *New Stadion* streets are conspicuous; and, in 1836, the foundation of a new palace was laid, and it was completed in 1843. The municipal affairs of A. are now regulated by a mayor (*demarchos*) and council elected by the citizens. Modern A. has a gymnasium, a library enriched with many donations from France and Germany, and a university, where about 52 professors and tutors are engaged. The number of students is about 1200. Several interesting works have been printed in A. The French government has founded an archaeological institute, and several missionary societies have branches here. A. has several printing establishments, soap-works, leather-works, and silk and cotton factories. Pop. '71, 44,510.

*Political History of A.*—It was the Ionic race that manifested most signally the distinguishing characters of Greek civilization; and of this portion of Hellas, A., in the brilliant part of its history, stands out most prominently. According to tradition, its political power was first established by Theseus, king of Attica, who made A. the metropolis. Here he instituted the great popular festival of the Panathenæa, and, by encouraging settlements in the city, greatly increased its population. He divided the citizens into three classes: nobility, agriculturists, and mechanics. Until the death of Codrus in 1068 B.C., A. was governed by kings; afterwards, by archons elected from the nobility. The time of holding office was limited to 10 years in 752 B.C., and to 1 year in 683 B.C., when 9 archons were annually elected, one being called the *archon eponymus*, because the year was distinguished by his name. Here begins the authentic history of A. These archons, together with the council of nobles, afterwards called the *areopagus*, exercised the whole power of the state, and administered justice. The Athenian government was thus, like all other Hellenic governments, an oligarchy; but the changes introduced by the archon Solon, 594 B.C., though remarkably moderate, laid the foundation of that democratic constitution which was afterwards perfected by Cleisthenes. The condition of the population at the time of Solon was one of extreme suffering and discord, arising chiefly from the oppressive execution, by the aristocratic archons, of the law of debtor and creditor. This law was of old extremely harsh in Greece as well as in Rome; it assigned the debtor that could not fulfill his contract as the slave of his creditor. The great part of the soil of Attica was in the hands of the rich, and the mass of the population, who tilled the lands as tenants, were either in hopeless arrears, or already, with their families, actual slaves. Driven to desperation, the populace were ready to rise in mutiny; the oligarchy were afraid or unable to enforce the laws; and thus it was agreed to confer dictatorial power on Solon, well known for his wisdom, integrity, and sympathy with the people, and allow him to solve the problem. The disease being desperate, Solon applied the desperate remedy of abolishing existing contracts, liberating those that had been reduced to slavery, and forbidding for the future any one from pledging his own person or that of a member of his family. He next reformed the political constitution by dividing the freemen into four classes, according to the amount of their property. It was only the richer classes that paid taxes and were eligible to the offices of state; but all had votes in the assembly that elected the archons, and all sat in judgment on their past conduct, on the expiry of their year of office. The government, though still oligarchical, was thus modified by popular control. Its free operation was for some time (560–510 B.C.) interrupted by the usurpation of Peisistratus and his sons, whose *tyranny*, however, was mild and enlightened, the forms at least of the Solonian constitution being preserved.

On the banishment of the Peisistratidæ (510 B.C.), a further political reform was introduced by Cleisthenes, who extended the basis of the constitution, and rendered it essentially democratic. To Cleisthenes is ascribed the origin of the practice called *ostracism* (q.v.).

Then followed the brilliant period of the Persian war, when, out of the circumstances

which had seemed to threaten destruction, A. rose to the highest point of power and prosperity. Miltiades at Marathon, and Themistocles at Salamis, gained the victories which infused new courage and enthusiasm into the Greek nation. The period between the Persian war and the time of Alexander the great, or from 500 to 336 B.C., was the most glorious in Athenian history; and in 444, Cimon and Pericles raised the city to its highest point of grandeur and beauty. But under Pericles, the beginning of a decline took place, through the decay of ancient morals and the Peloponnesian war, which ended in the capture of A. by the Lacedæmonians. After this, A. retained only the shadow of its former power and dignity. The thirty appointed ministers of government were, in fact, so many tyrants, supported by the Lacedæmonian army. After eight months of despotism had been endured, the tyrants were expelled by Thrasybulus, a free constitution was restored to A., and a new period of prosperity commenced. But it was not destined to endure long; a formidable foe, Philip of Macedon, now appeared in the north. The Athenians having opposed him in the Phocian war, Philip took from them several of their colonies. Then followed the defeat of the Athenians at Chæroneia (338 B.C.), a fatal blow to Greece. A. with other states became subject to Macedon. The free spirit of the citizens was broken, and in moral character they degenerated. After Alexander's death, a fruitless attempt was made to regain their liberty. Antipater instituted an oligarchy of wealth. Soon afterwards, A. was taken by Cassander, and placed under the rule of Demetrius Phalereus, who employed his power wisely and beneficently. Once more the old constitution of A. was restored by Demetrius Poliorcetes, and a short interval of independence was enjoyed, until the city was taken by Antigonus Gonatas. After liberating themselves from the dominion of Macedon, and joining the Achaian confederacy, the Athenians were so misguided as to support Mithridates against the Romans. This last error was fatal. Sulla conquered A., destroyed the port of the Peiræus, and left only the appearance of liberty and independence, which entirely vanished in the time of Vespasian. Still, after the spirit of liberty and progress had departed, A. long remained safe from spoliation. The Romans, in their respect for Grecian pre-eminence in art and philosophy, and moved also by religious reverence, long regarded Athens as a captive too noble and beautiful to suffer any indignity.

**ATHENS**, a co. in s.e. Ohio, on the Ohio river; intersected by Hocking river, and the Marietta and Cincinnati, and the Columbus and Hocking Valley railroads; 430 sq. m.; pop. '70, 23,768. It is well wooded and fertile, and has coal and iron. Large quantities of salt are manufactured. Co. seat, Athens.

**ATHENS**, a name applied to 23 places in the United States. The most important of them is a thriving town in Georgia, 92 m. to the w.n.w. of Augusta. It is the terminus of a branch railway, which joins the Georgia Central. It contains several cotton factories, and is the market for an extensive cotton-growing region. It is the seat also of the university of Georgia, and has three newspapers. Pop. '71, 4251.

**ATHERINE**, *Atherina*, a genus of small fishes, allied to the mullet family (*mulgildæ*), but latterly separated into a distinct family, *atherinidæ*. The atherines have more than twice as many vertebrae as the mullets; they are of a rather slender form; but few of them exceed 6 in. in length. They have a protractile mouth, and very small teeth; some are quite toothless. Almost all the known species, which are numerous, and found in the seas of different parts of the world, have a broad silvery band along each flank. Some of them are much esteemed for their delicacy. They all congregate in great shoals. They abound in the Mediterranean. One species, *A. presbyter*, is very common on the s. coast of England and on some parts of the coast of Ireland, but is rare on the e. coast of Britain. In the markets of some of the southern towns of England, where the smelt (q.v.) is unknown, it is sold under that name; in Brighton and some other places, it is called *sand smelt*. Where this fish abounds, it is often taken by anglers from the shore, biting readily at almost any bait.

**ATHEROMA**, or "fatty deposit," is generally found in the tissues of aged persons, or those who have lived dissipated and ill-nourished lives. In appearance, it is yellow and cheesy, showing under the microscope fatty granules and crystals of cholesterine. Its most common situation is between the middle and inner coats of arteries, and is dangerous, inasmuch as it interferes with the elasticity of the arterial tube, rendering it more liable to injury, and less able to repair itself, should any occur. A. generally precedes aneurism (q.v.). Cysts filled with contents resembling bread-sauce, which frequently occur in the scalp, are termed atheromatous tumors.

**ATHERSTONE**, a market t. of Warwickshire, England, on the borders of Leicestershire, 16 m. n.e. from Birmingham; in a valley surrounded by finely wooded hills, on the Roman road called Watling street, the Trent Valley railway, and the Coventry and Fazely canal. The town is irregularly built; many of the houses are very ancient; the old houses are of stone, the modern ones of brick. Some of the modern churches and other public buildings are handsome structures. Hats, stockings, and ribbons are manufactured here. Pop. '71, 3661.

**ATHERTON**, CHARLES GORDON, 1804-53; b. N. H., senator of the United States from New Hampshire. He was a member of the lower house of congress, where, Dec. 11, 1838, he introduced what gave him the cognomen of "gag-rule Atherton." It was a

resolution to lay on the table, without reading or reference, any petition touching the subject of slavery. A.'s resolution passed by 120 votes to 78, and for several years all such petitions were treated with entire silence. A. was chosen to the senate in 1842, and again in 1852.

ATHIAS, JOSEPH, a printer of Amsterdam, who printed two editions of the Old Testament in Hebrew, remarkably accurate, and the first edition in which the verses were numbered in figures. For this and other meritorious works, the states-general gave him a gold medal.

ATHLETE (Gr. *athleo*, to contend), the name given to a combatant, pugilist, wrestler, or runner, in ancient Greece. Athletics were studied in Greece as a branch of art, and led to several useful rules of diet, exercise, etc., applicable to ordinary modes of life. Bodily strength and activity were so highly honored by the Greeks, that the A. held a position in society totally different from that of the modern pugilist. When he proposed to enter the lists at the Olympic or other public games, he was examined with regard to his birth, social position, and moral character. A herald then stepped forth and called upon any one, if he knew aught disgraceful to the candidate, to state it. Even men of genius contended for the palm in athletic exercises. Chrysippus and Cleanthes, the famous philosophers, were victorious athletes, or, at least, *agonistes*, i.e., persons who pursued gymnastic exercises, not as a profession, but for the sake of exercise, just as at the present day we have gentlemen-cricketers, amateur-pugilists, etc. The profound and eloquent Plato appeared among the wrestlers in the Isthmian games at Corinth, and also in the Pythian games at Sicily. Even the meditative Pythagoras is said to have gained a prize at Elis, and gave instructions for athletic training to Eurymenes, who afterwards gained a prize at the same place. So great was the honor of an Olympian victor, that his native city was regarded as ennobled by his success, and he himself considered sacred. He entered the city through a special breach made in the walls; he was supported at the public expense; and when he died, was honored with a public funeral. Euthymus, of Locri in Italy, who had, with only one exception, been regularly victorious at Elis, was honored with a statue, to which, even during his lifetime, homage was paid by command of an oracle. Athletic sports were first witnessed at Rome 186 B.C. They were introduced by M. Fuivius at the end of the Ætolian war, and became excessively popular in the time of the emperors. At Rome, the athletes formed a corporation.

ATHLONE, a small t. in the center of Ireland, on both sides of the Shannon, chiefly in the co. of Westmeath, but partly in that of Roscommon. It is the largest town between Dublin and Galway, and lies on a commanding situation, 3 m. below Lough Ree, in a carboniferous limestone district. The chief manufactures are felt hats, friezes, linens, and staves. A canal here, a mile long, enables large river-steamers to navigate the Shannon for 116 m., from Killaloe to Carrick-on-Shannon, uninterrupted by the river-rapids. The Shannon is crossed by a fine bow-string and lattice iron bridge of two arches, 175 and 40 ft. span. Pop. '71, 6365. A. sends one member to parliament. A. castle, on the Roscommon bank of the Shannon, was founded in the reign of king John, and has now been rendered one of the chief military positions in Ireland. The fortifications cover 15 acres, and contain barracks for 1500 men.

ATHOL, a t. and village in Worcester co., Mass., on Miller's river and the Vermont and Massachusetts railroad, at its junction with the Springfield, Athol and North-eastern, 48 m. n.e. of Springfield; pop. of township, 4134. There are manufactories of iron, woolen goods, boots and shoes, etc.

ATHOLE (Pleasant Land), a district of 450 sq.m. in the n. of Perthshire. It occupies a great part of the southern slopes of the Grampian mountains, and is intersected by many narrow glens, down which flow the rapid tributaries of the Tay. It is chiefly composed of gneiss and quartz rock, with beds of primary limestone. Dr. Hutton's explorations among the granite veins in Glen Tilt, were among the chief means of establishing the Plutonic theory of geology. A. was once one of the best hunting districts in Scotland. Athole deer-forest is said to contain 100,000 acres, and 10,000 head of deer, of which 100 are killed annually. In the picturesque pass of Killiecrankie, in this district, 17 m. n.w. of Dunkeld, Claverhouse fell in 1689, though victorious over the troops of king William III.

ATHOR, or ATHYR, but properly, *Het-her*, i.e., "the habitation of God," the name of an Egyptian goddess who, in the mythological system of that people, is ranked among the second class of deities. She was the daughter of Ra, the sun. By the Greeks, she was identified with Aphrodite (Venus). The cow was regarded as her symbol, and, in hieroglyphics, she generally appears with the head of that animal, bearing between her horns the figure of the sun's disk. A. is also represented as a cow itself, and as a bird with human face, horns, and the sun's disk. On the oldest monuments, she is frequently portrayed bearing a temple on her head, as in the Athor-capitals of the Ptolemaic buildings, falsely supposed to be heads of Isis. Originally, the goddess had a cosmogonic significance; later, she was called the "mistress of dance and jest," and held in her hands, as symbols of joy, the cord of love and the tambourine. Queens and princesses were often represented by the figure of A. Her worship was generally spread through

Egypt. Her most sacred abode was at Denderah. After her the third month of the Egyptian year was named.

**ATHOS**, HA'GION O'ROS, or MON'TÉ SAN'to, i.e., the Holy hill, the principal mountain of a chain extending, in a peninsular form, from the coast of Macedonia into the Aegean sea, between the gulfs of Contessa and Monté Santo, and connected with the mainland by a narrow isthmus. The length of the peninsula is 40 m.; breadth, 4 m. According to tradition, it received its name from A., son of Neptune, or from A., a giant who battled against the gods. The highest summit in the chain, or Mt. A. proper, a solitary peak at the southern extremity of the peninsula, rises 6350 ft. above the sea-level. In ancient times, several towns were built on A. Herodotus mentions five. The most memorable thing in connection with A., is the canal which Xerxes cut through the isthmus, in order to escape the stormy gales which rendered the navigation round the promontory very perilous, and which had shattered the fleet of Mardonius some years before. Traces of this canal still exist. In the middle ages, A. was covered with monasteries, of which 20 still remain (besides several hermitages, chapels, etc.). The largest are the monasteries of Ivoron and St. Laura; the richest, Vatopadi. The entire number of monks who inhabit the "Holy hill" is about 8000. They form a kind of monastic republic under the Turkish government, to which they pay an annual tribute of nearly £4000. The monks follow the rule of Basilus, and lead an ascetic life, engaged chiefly in agriculture, gardening, and the care of bees. In diet, they restrict themselves to herbs, fruits, and fish. They carry on a considerable trade in amulets, images, crucifixes, wooden articles of furniture—all of their own manufacture—and also reap profits from the numerous visits of pilgrims. Karyas, the principal place in the peninsula, is picturesquely situated in the midst of vineyards and gardens, and has 1000 inhabitants. Here the market is held; but no female, even of the animal kind, is permitted to be present, or even to enter the peninsula. In the middle ages, A. was the center of Greek learning and Christian-Byzantine art. Now, scarcely more than two or three monks, of tolerable education, can be found in a monastery. The libraries are neglected, though containing several beautiful old manuscripts, some specimens of which have been brought to western Europe. They contain, however, little or nothing of value in classical literature.

**ATHY**, a small t. in the s.w. of Kildare co., Ireland, on the e. side of the river Barrow, here joined by the Grand canal. It lies in a carboniferous limestone district. It chiefly consists of two main streets. Pop. '71, 4510. Its chief export is grain.

**ATITLAN**, or ATITAN, a lake in Guatemala, 20 m. long, 8 to 10 m. wide, apparently in the crater of a volcano, and so deep that bottom has not been found with a line of 600 yards. It receives some small streams, but has no known outlet. Near it is an Indian town of the same name, with about 2000 inhabitants.

**ATLANTA**, a flourishing city of Georgia. It owes its prosperity chiefly to its situation, five important railways connecting here—the Atlanta and West Point, the Atlanta and Richmond, the Georgia, the Macon and Western, and the Atlantic and Western. Independently of these means of communication, the surrounding country, besides being rich in grain and cotton, contains gold, iron, and other valuable minerals. A. was destroyed by gen. Sherman, Nov., 1864, but is rapidly recovering its former prosperity. Pop. '70, 21,789.

**ATLANTA** (*ante*), a city in Fulton co., Ga., called the "Gate city." After the war, A. speedily recovered from almost complete ruin, and within two years had as great a population as when the rebellion began. It was made the capital of the state in 1868, and since then it has grown rapidly, having in 1879 about 30,000 inhabitants. Among its manufactories is an immense iron-rolling mill, employing many hundreds of men. It is a port of entry, and has a custom-house. Among the public institutions are the Oglethorpe university, the North Georgia female college, the A. medical college, and the A. university for colored students. It is one of the most important railway centers in the south, having direct lines to all sections of the union.

**ATLANTES**, in arch., so called, by the Greeks, in reference to the mythical Atlas (q.v.), are male figures used instead of columns. The Romans called them Telamones.

**ATLANTIC**, a co. in s.e. New Jersey, on the Atlantic ocean; 620 sq.m.; pop. '80, 18,706. It is for the most part flat, and marshy near the water, but with dry and light soil inland. The Camden and Atlantic railroad from Philadelphia to Atlantic City runs centrally through the county. Co. seat, May's Landing.

**ATLANTIC CITY**, a watering-place on the sea-coast, on a long, narrow, sandy island, known as Absecon beach, in Atlantic co., N. J., 60 m. s.e. of Philadelphia; pop. '70, 1043. It is the terminus of the Camden and Atlantic, and the Philadelphia and Atlantic City railroads. The beach, or island, is 10 m. long by less than a mile wide, and is separated from the mainland by a narrow channel. Absecon light is on the n. end of the beach. The city is well laid out, with broad avenues named after the principal oceans, and cross streets bearing the names of the states of the union. There are many hotels, boarding-houses, and private cottages for the accommodation of summer visitors. There are several churches and one newspaper. The city incorporation dates from 1854.

**ATLANTIC OCEAN**, so called either from Mt. Atlas, or from the fabulous island of Atlantis, is that part of the ocean that divides the old world from the new. Its extreme breadth is about 5000 m., and its narrowest part, between cape St. Roque, in Brazil, and the nearest point in Africa, about 1600 miles. If the A. be supposed to be bounded by the polar circles, and to include the Caribbean sea, Hudson bay, Mediterranean sea, and the other connected water-surfaces, it covers an area computed at 35 million sq. miles. The A. is naturally divided into three portions—the north, south, and inter-tropical A. It stands in open connection with the n. and s. polar seas, and in the remarkable parallelism of its coasts, resembles rather a vast river than an ocean. Its northern half sends off numerous ramifications on both sides, some of them forming almost shut seas: on the w., Hudson's bay, the gulf of St. Lawrence, and the gulf of Mexico; on the e., the Baltic, North, Mediterranean, and Black seas. In the s., again, both coasts present a comparatively unbroken line; and there is a remarkable correspondence between their projecting and retiring angles, the convex coast of Brazil lying opposite to the gulf of Guinea, and the projection of Senegambia answering to the retirement of the American coast in the Caribbean sea.

The whole of the new world, with the exception of the narrow strip lying w. of the Andes and Rocky mountains, belongs to the *basin* of this ocean. It drains comparatively little of the old world, as may be seen by tracing the water-shed on a map. Owing to the numerous seas and inlets connected with it, the extent of its shores is immense, over 50,000 m., several thousands more than that of the shores of the Pacific and Indian oceans. Except near the continents, the Atlantic is poor in islands compared with the Pacific. The chief islands in the open ocean are Iceland, Farø, Bermudas, Azores, Ascension, St. Helena, the Falkland islands, South Georgia, and Sandwich land.

The A. is the great highway of the civilized world, and everything that concerns its navigation is of great importance. Under the system of observations carried on for many years by the governments of Holland, Great Britain, the United States, and France, much has been done to amass information as to its currents, winds, depth, temperature, etc., the chief results of which either have been or are in the course of being published. The operations connected with the telegraph-cable were also the means of furnishing us with some valuable information regarding the Atlantic.

The chief A. currents are two. The *equatorial current*, which, starting from about the island of St. Thomas, in the gulf of Guinea, with a rate of motion varying from 18 to 24 m. a day, proceeds westwards on both sides of the equator till near cape San Roque, where it divides, one branch running s. along the coast of Brazil, and the other along the coast of Guinea into the Caribbean sea. The velocity of this current is 24 m. a day at the point where it curves s., whence it gradually diminishes in strength as it proceeds southward to little more than 6 m. a day. Within the south A. there is a complete circulation of the waters, induced by the prevailing winds, and maintained at about 12 m. a day. Its force also varies with the months, being determined by the prevailing force of the wind of each month. Its breadth varies from 200 to 400 m.; and since it is fed by currents from n. and s. of it, its temperature is consequently considerably lower in the eastern than in the western part of its course. The other great current is the *gulf stream*. This, originally part of the equatorial current, after flowing past the Guinea coast, and through the Caribbean sea, issues from the gulf of Mexico through the strait of Florida, and after following the direction of the American coast to about 40°, turns seaward, touches the great Newfoundland bank, and gradually curving round, is lost as a distinct current about the Azores (see GULF STREAM). The water of this stream is often upwards of 20° warmer than the surrounding ocean. The gulf stream has an immense influence on the Atlantic. Besides these great currents, the A. abounds in smaller ones, such as the northerly currents along the e. Greenland and Labrador coasts (this Arctic current extending as far s. as 36° n. lat., its rate being from 24 to 10 m. a day); the southerly current along the w. of Greenland; Rennel's current, w. of the bay of Biscay; and the great current along the w. of Africa, from Morocco southwards, till it is merged in the Guinea current. The whole of these currents follow in every case the prevailing winds of the regions where they flow.

Since over the whole of the eastern half of the A., from about n. lat. 45° northwards, the prevailing winds are south-westerly, there is over the same region a general flow of the water of the ocean towards the n.e., passing the British Isles, and thence along the coast of Norway, to some distance e. of the North cape. It is to this circumstance that the mild temperatures of north-western Europe must be referred. The amelioration of the winter climates from this cause is very great, amounting to about 30° in the Hebrides, and to fully 40° in the Lofoden islands. This effect is directly brought about, not by the winds alone, but by the influence of the winds and sea combined. The influence of currents on the temperature of the ocean is so great, that even in Aug., the isothermal of 50° touches the n. of Norway in lat. 72° n., whereas to s.e. of Newfoundland the same isothermal descends to about lat. 43° n. Again, on the meridian of 74° w., the change of temperature from lat. 40° to 35° n., or in 300 m., is 18°.0; whereas on the meridian of 20° w. from lat. 40° to 10°, a distance of 1800 m., the change of the temperature of the sea is only 15°.0.

The temperature of the A. about the equator is, if we except the part between 20° and 35° w. long., above 80°: that of the gulf of Guinea reaches the maximum of 85° in

April; from Oct. to May it is above 80°; in June and Sept. about 80°; and in July and Aug. it falls below 80°: that of the Caribbean sea is above 80° from July to Oct., during the rest of the year below 80°, except in July. Between 10° and 30° lat. n., the temperature of the eastern part of the A. is always from 3° to 7° colder than the western, and the maximum and minimum temperatures take place later in the year in the Caribbean sea than off the African coast.

Much has been done recently, particularly by H.M.'s ships *Porcupine* and *Challenger*, in throwing light on the physical geography of the A. The most important of the observations are those of deep and bottom temperatures, from their connection with oceanic circulation, and the distribution of life in the depths of the sea, and the bearings of the questions thereby raised on geological speculation (see art. SEA). Animal life abounds at much greater depths than was formerly supposed; although beyond 6000 ft. it gradually diminishes. A great part of the bottom of the n. Atlantic is covered with a slimy "ooze," composed for the most part of the chalk-producing globigerina; in very deep parts this is replaced by a brown, clay-like mud, with few traces of animal forms.

Regarding the depth of the A., it is only recently that reliable data have been obtained; along certain tracts, especially those of the *Challenger*, the profile of the bottom can now be laid down with considerable certainty. The deepest sounding made by the *Challenger* with its improved method of sounding (see SOUNDINGS), is 3875 fathoms, or 23,250 ft., at a point about 90 m. off St. Thomas, West Indies. A remarkable ridge, about 400 m. wide, and 10,000 to 12,000 ft., or 2 to 2½ m., below the surface of the sea, extends along the bottom of the A. from cape Clear in Ireland to cape Race in Newfoundland, a distance of 1640 miles. Along this, which is known as the "telegraph plateau," the Atlantic cables are laid.

**ATLANTIC TELEGRAPH.** Referring to other articles for details concerning the scientific and mechanical principles of electro-telegraphy, the Atlantic cables may more especially be described here.

The possibility of laying an electric cable in the Atlantic, from Europe to America, was suggested by prof. Morse so far back as 1843; but it was not until 1854 that Mr. Cyrus Field and others discussed the means of practically realizing the idea. Lieut. Maury discovered that the bed of the Atlantic, between Ireland and Newfoundland, forms a kind of plateau, covered with soft ooze, favorably situated as a resting-place for a cable. In 1855, negotiations were carried on, partly in America, but chiefly in England, to establish a company and raise capital; which objects were attained in 1856. The "New York and Newfoundland Telegraph company" connected Newfoundland with the mainland of America by cables and land-wires; but the "Electric Telegraph company" undertook the laying of a cable from Newfoundland to Ireland, with a capital of £350,000, in shares of £1000 each. A length of 2500 English miles of cable was ordered, and was completed by the summer of 1857. The conductor consisted of 7 fine copper wires, No. 22 gauge, twisted tightly together, forming a cord  $\frac{1}{4}$  in. thick, and weighing 107 lbs. per mile. This thickness was increased to  $\frac{3}{16}$  in. by a core of three layers of gutta-percha. Outside the core was a jacket of hempen yarn, saturated with pitch, tar, beeswax, and boiled linseed oil. The outer sheath consisted of 18 strands, each formed of 7 No. 22 iron wires. The whole diameter was about  $\frac{1}{16}$  in., and the weight 1 ton per mile. In the manufacturing processes, the wires and yarns were twisted round each other by revolving drums and circular tables worked by steam-power; while the coatings of gutta-percha were applied by forcing the substance through dies which had the copper conductor passing through their center. The *Niagara* and the *Agamemnon*, the one lent by the U. S. government and the other by the English, took 1250 m. of the cable each, and steamed forth from Valentia (w. coast of Ireland) on Aug. 7, 1857. The *Niagara* paid out her portion of cable as she went. On the 11th, in an attempt to slacken the rate of paying out, the cable snapped, and the end sank in 2000 fathoms water, at 280 m. from Ireland. The appliances on board were not sufficient to remedy the disaster, and the two ships returned to Plymouth, where the two portions of cable were placed in tanks until the next following year.

The Atlantic Telegraph company raised more capital, made 900 m. additional cable, and prepared for a new attempt in 1858. The *Niagara* and *Agamemnon* were again employed; but the submersion was to begin in mid-ocean, one ship proceeding eastward, and the other westward, after splicing the two halves of the cable. They left Valentia June 10; but it was not till the 26th that they could finish the splice and commence the submersion. On the 29th, a double breakage took place, and 144 m. of cable went to the bottom, wholly severed from the rest. The *Agamemnon* returned to England for improved appliances and further instructions; and a month was thus lost. On July 29, the two ships again spliced their two halves of cable in mid-ocean, and proceeded with their work without further disaster. On Aug. 6, the *Agamemnon* reached Valentia, and the *Niagara* Newfoundland, and exchanged congratulatory messages through the whole length of cable. Soon afterwards, greetings were exchanged between the queen and the president, and between many public bodies and official persons. The station at Newfoundland was connected by wires and cables with the general telegraphic system of America; and that at Valentia with the general system of Europe. The cable continued working until Sept. 1, sending 129 messages (of about 11 words each on an average) from

England to America, and 271 from America to England. The signals then ceased, and the cable became useless; it had been injured by the winter's sojourn at Plymouth.

From 1858 to 1864, the company were engaged in endeavoring to raise new capital, and to obtain increased subsidies from the English and American governments; while scientific men were making improvements in the form of cable, and in the apparatus for submerging it. At length the Telegraph Construction and Maintenance company (formed by an amalgamation of the Gutta-percha company with the wire-cable-making firm of Glass & Elliott) made an entirely new cable, much thicker and more costly than the former one. The conductor, 300 lbs. per mile, and  $\frac{1}{4}$  in. thick, consisted of 7 No. 18 copper wires, each  $\frac{1}{8}$  in. thick. The core was formed of four layers of gutta-percha alternating with four of Chatterton's compound (a solution of gutta-percha in Stockholm tar); the core and conductor together were 700 lbs. per mile, and  $\frac{3}{8}$  in. thick. Outside this was a jacket of hemp or jute yarn, saturated with preservative composition. The sheath consisted of 10 iron wires, No. 13 gauge, each previously covered with 5 tarred manilla yarns. The whole cable was  $1\frac{1}{2}$  in. thick, and weighed  $35\frac{1}{2}$  cwt. per mile, with a breaking strain of  $7\frac{1}{2}$  tons.

As the cable (2300 m.) weighed more than 4000 tons, it was resolved to employ the *Great Eastern* steamship to carry it out and lay it. Three enormous iron tanks were built in the fore, middle, and aft holds, from 50 to 60 ft. diameter each, by 20 $\frac{1}{2}$  ft. deep; and in these the cable was deposited, in three vast coils. On July 23, 1865, the *Great Eastern* started from Valentia with her burden, the main cable being joined end to end to a more massive shore cable, which was drawn up the cliff at Foiliummerum bay, to a telegraph house at the top. The electric condition of the cable was kept constantly under test during the progress of the ship; and more than once the efficiency was disturbed by fragments of wire piercing the gutta-percha and destroying the insulation. On Aug. 2, the cable snapped by over-straining, and the end sank to the bottom in 2000 fathoms water, at a distance of 1064 m. from Ireland. Then commenced the remarkable process of dredging for the cable. A five-armed grapnel, suspended from the end of a strong iron-wire rope, 5 m. long, was thrown overboard; and when it reached the bottom, it was dragged to and fro across the line of cable by slow steaming of the *Great Eastern*; the hope being that one or other of the prongs would catch hold of the cable. A series of disasters followed by the breaking of swivels, and the loss of grapnels and ropes; until at length, on Aug. 11, it was found that there were no more materials on board to renew the grappling. The *Great Eastern* returned to England, leaving (including the operations of 1857-1858) nearly 4000 tons of electric cable useless at the bottom of the Atlantic.

A new capital, and new commercial arrangements altogether, were needful for a renewal of the attempt. Another cable was made, slightly differing from the former. The jacket outside the core was made of hemp instead of jute; the iron wires of the sheath were galvanized, instead of being left in their natural state; and the manilla hemp which covered them was left white instead of being tarred. These few changes made it weigh nearly 500 lbs. per mile less, mainly through the absence of tar; while its strength or breaking strain was increased. Enough of this cable was made to span the Atlantic, with allowance for slack; while a sufficient addition of the 1865 cable was provided to remedy the disaster of that year.

The A. T. operations in 1866 were of a remarkable and interesting kind. On July 13, the *Great Eastern* set forth from Valentia, accompanied by the steamers *Terrible*, *Medway*, and *Albany*, which were to assist in the submersion and in subsidiary matters. The line of route was chosen midway between those of the 1858 and 1865 cables, for the most part a few miles from each. The *Great Eastern* exchanged telegrams almost continuously with Valentia during her progress. The mishaps were few in number, and easily remedied; and the *Great Eastern* safely entered the harbor of Heart's Content, Newfoundland, on the 27th. After this, operations commenced for recovering the end of the 1865 cable, and completing the submersion. The *Albany*, *Medway*, and *Terrible* set off, on Aug. 1, to the spot on the ocean beneath which the end of the cable was lying, or as near to it as calculations could establish. Certain buoys, left anchored there twelve months previously, had been carried away by the storms of the preceding winter; but the latitude and longitude had been very carefully registered. The *Great Eastern* started from Heart's Content on the 9th, and then commenced a series of grappling operations, which continued through the rest of the month. The cable was repeatedly caught, and raised to a greater or less height from the ocean-bed; but something or other snapped or slipped every time. After much trial of patience, the end of the cable was safely fished up on Sept. 1; and electric messages were at once sent through to Valentia, just as well as if the cable had not had twelve months' soaking in the Atlantic. An additional length having been spliced to it, the laying recommenced; and on the 8th the squadron entered Heart's Content; having thus succeeded in laying a second line of cable from Ireland to America.

Mishaps have since taken place; but in every case the injuries have been attended to, and the two cables maintained in good working order. The rapidity of signaling (at first only two words per minute) was greatly increased; the tariff of charges was lowered; the public of the two nations used the cable-telegraph extensively; and the

company realized good dividends, notwithstanding the heavy expenditure which had been incurred.

The art of laying submarine cables being thus established, many other projects for Atlantic telegraphy have from time to time been started. One scheme was for a line from the n. of Scotland to Farøe islands, Iceland, Greenland, and some point near the mouth of the St. Lawrence; but the projectors did not succeed in raising capital. A French company afterwards planned a direct route from France to America. In June, 1869, the *Great Eastern* steamed out of Brest with this new cable, no less than 2323 m. long; and the submersion was successfully effected. There is a connection between Brest and Falmouth. A new French cable from Brest to the island of St. Pierre, to the s. of Newfoundland, was laid in the end of 1879. In the year 1874, a third British cable was successfully laid from Ireland to Newfoundland. A "Direct United States Cable Company" was also formed; Messrs. Siemens undertook the manufacture of the cable, the lightest yet planned for Atlantic telegraphy, its weight being 480 lbs. of copper and 400 lbs. of gutta-percha per mile; about 3060 m. were needed from Ireland to New Hampshire. The laying of this cable was completed early in the summer of 1875.

Lower down the Atlantic, extensive operations have been or are being completed. When a cable had been laid from Falmouth to Lisbon, the latter became the starting-point for extensive ocean routes. The "Brazilian Submarine Cable Company" began in 1873 a cable to extend from Lisbon to Madeira, St. Vincent, and Pernambuco. The whole length is 4000 m., of which the longest section (across the ocean) is somewhat under 2000 m.; it is connected at Pernambuco with other cables to Para, Rio Grande, etc.

There is a "Direct Spanish Cable" from the Lizard to Bilbao; and there are duplicate lines from Falmouth to Lisbon. In and near the gulf of Mexico, the electricians have been working with great energy. Most of the principal West India islands are connected by cable one with another, with Colon (Panama), and with the U. S. mainland at Florida.

**ATLANTIC TELEGRAPH, HISTORY OF.** In 1842, prof. Morse, of New York, having stretched a submarine cable between Castle Garden and Governor's island, New York, and succeeded in transmitting an electric current from one end to the other, expressed his opinion that it would be possible to effect an electrical communication through the sea. After further investigations, he announced to the secretary of the treasury of the United States, "that a telegraphic communication on his plan might with certainty be established across the Atlantic." Three years prior to that, sir William O'Shaughnessy gave practical proof that electrical messages could be conveyed through water, by depositing a cable in the bed of the Hooghly; but it was the successful submarine telegraphic undertakings of the Messrs. Brett, who, in June, 1845, registered a "General Oceanic Telegraph Company," with the object among others of joining this country with America by means of a telegraph "across the Atlantic ocean," and six years afterwards united England with France (see *TELEGRAPH, History*), that first fairly convinced the public mind that the new world might be put on what may be called conversational terms with the old. The supposed great depths of the Atlantic ocean presented the most imposing obstacle to this desired closeness of communion; but when it was discovered that between Ireland and Newfoundland there extended, along the bottom of the Atlantic, at a depth of not more than two miles below the surface, a fine broad platform (see *ATLANTIC OCEAN*), seemingly so specially formed by nature for the purpose of electrical communication, that capt. Maury at once designated it the telegraphic plateau, the project of an Atlantic submarine cable assumed a practical form. In 1854, the colonial government of Newfoundland passed an act incorporating a company to establish a telegraphic communication between the old world and the new, and aided it by a subsidy, and by grants of lands. The colonial government also conferred upon the company the exclusive right of landing a telegraphic line upon the coast under its jurisdiction. The governments of Prince Edward's island and the state of Maine made similar concessions; and authority for certain subsidiary operations in Canada was also obtained. The company, incorporated under the title of "The New York, Newfoundland, and London Telegraph Company," commenced operations by uniting St. John's in Newfoundland with lines in the United States and British North America. This done, numerous preliminary experiments were undertaken by eminent electricians and engineers, in order to determine the amount of retarding force which inducted and disguised electricity were likely to offer to the transmission of currents along submarine wires of unusual length. Having by these experiments, 2000 in number, tried with 62 different kinds of cable, determined the one best adapted for the conveyance of electricity through such a length, and at such a depth in the Atlantic, the next step was the formation of a more influential company. In 1856, "The A. T. Company," to which all the privileges conferred on the old company were handed over, was formed with a capital of £350,000. The governments of Great Britain and the United States liberally aided the company, guaranteeing, by a contract of 25 years' duration, to pay to the company, until such time as its dividend reached 6 per cent, a subsidy of £14,000 a year, and of £10,000 subsequently. They also agreed to furnish ships for laying down the cable.

The cable, which weighed about a ton per mile, equal to 14 cwt. in water, was composed of a strand of seven wires of pure copper, coated with three separate layers of

gutta-percha, wrapped over with hemp saturated with pitch and tar, and finally bound round with iron wires, 332,500 m. of iron and copper wire being employed in its construction. It was deposited in the holds of the *Agamemnon*, a line-of-battle ship supplied by the British government, and the *Niagara*, a splendid frigate furnished by the United States, and the two vessels started on their grand mission. After two unsuccessful attempts during the years 1857 and 1858, the expedition started again for mid-ocean, whence the ships were to start, paying-out towards opposite shores, on the 17th of July, 1858. The cable was united and lowered on the 29th of the same month; and the *Agamemnon*, notwithstanding a severe gale of wind, arrived at Valentia, having successfully laid her portion of it, on the morning of the 5th of Aug. The *Niagara* about the same time arrived in Trinity bay, Newfoundland, and science had annihilated space between the old world and the new. On the 17th Aug., the extremities of the cable having been put in connection with the recording-instruments, the following message was flashed through the ocean in thirty-five minutes: "Europe and America are united by telegraph. Glory to God in the highest; on earth peace and good-will towards men." Messages and replies from the queen to the president of the United States, from the mayor of London to the mayor of New York, etc., followed. But on the 4th of Sept., the signals of Valentia became unintelligible. One commercial message of great importance passed through the cable, in reference to the collision between the Atlantic steamers, the *Europa* and *Arabia*; this single message saved the commercial world £50,000, which would doubtless have been spent in extra insurance on the vessels and cargoes thus delayed. The cable of 1858 having become useless, two other lines were laid in 1865 and 1866, between Great Britain and North America. A cable was laid in 1869 from France to the United States. For the history of the A. T. since 1869, see ATLANTIC TELEGRAPH, also TELEGRAPH.

ATLANTIC TELEGRAPH, HISTORY OF (*ante*). The first experiment in submarine telegraphy was made in 1839 by Dr. W. O'Shaughnessy at Calcutta. Having laid across the river Hoogly a copper wire, insulated with a covering of cotton thread saturated with pitch and tar, he was able to transmit signals through it. His experiment was followed in 1847 by that of J. J. Craven, who insulated an iron wire with gutta-percha and placed it in the circuit of the New York and Washington telegraph line, submerging it in the waters of a small creek. This led, in 1848, to the laying of a gutta-percha cable between New York and Jersey City. An experimental line laid across the English channel in 1850 was followed in 1851 by the permanent cable which is still in use. The success of this undertaking revived the project of a telegraph by way of Newfoundland for rapid communication with Europe. The plan was to carry the line across that island to St. John's, the farthest point on the American coast, and there connect with a line of fast steamers, which it was thought could reach the nearest point in Ireland in five days. Thus America could be brought easily within a week of Europe. In 1854, the attention of Mr. Cyrus W. Field, of New York, was directed to the subject, and while he was considering this proposal, and turning over the globe in his library, the thought flashed upon him, "why not carry the line across the ocean?"

But in a work of such magnitude, it was easier to conceive than to execute. To build the line across Newfoundland was no small undertaking. It was a distance of 400 m., through a wilderness, over land that was wild and waste, marsh and moor, or rocks and hills, and often through dense forests, where every step of the way had to be cleared by the woodman's axe. This overland work took nearly three years. Then to connect the island with the mainland, a cable had to be laid across the gulf of St. Lawrence. One was sent out from England in 1855, but the first attempt to lay it was a failure. The next year a second attempt was made with success. The work thus completed, though costly, was merely preliminary to the more serious undertaking which now began. The practicability of a transatlantic telegraph was doubted by many of the first authorities, both in England and America. Eminent engineers declared that it was beyond the resources of human skill to span the ocean with a cable over 2000 m. long. Even the great Robert Stephenson shook his head, and anticipated only failure. Electricians added that even if it were laid, the electric current could not be sent that distance. To be sure, there were eminent authorities on the other side. The great Faraday encouraged the American projector. But still both scientific men and practical men were so divided, that it was very difficult to inspire in either country the degree of confidence necessary to success. In face of all these obstacles, Mr. Field went to London, and there succeeded in 1856 in organizing the first Atlantic telegraph company and raising the necessary money to carry out the project, subscribing himself for more than one quarter of the entire capital.

The English and American governments gave their aid in the use of ships. The first attempt was made in 1857, but the cable was paid out only about 300 m. from the Irish coast, when it broke, and the ships returned to England. The attempt was renewed the following year. The cable was then placed on board the *Niagara* of the United States navy and the *Agamemnon* of the British navy, which sailed for the middle of the Atlantic. Before reaching it, the *Agamemnon* came near foundering during a severe gale, which lasted several days. Arrived at last in mid-ocean, the ships spliced their separate portions of the cable, intending to sail in opposite directions, the English ship for Ireland, and the *Niagara* for Newfoundland. But the first attempt met with nothing but disaster.

Scarcely were the cables joined before they were parted. The attempt was made several times with the same ill success, and both ships returned to England. Then came the severest trial—for even the directors lost faith. When it was proposed to renew the attempt the vice-president left the room in disgust, and refused to take part in an undertaking so hopeless. But the rest stood by manfully, and resolved to try again. The ships returned to mid-ocean, and to the amazement of the world, this time the experiment proved a success. The cable was successfully laid, and messages were sent from shore to shore. The first one was "England and America are united by telegraph. Glory to God in the highest, and on earth peace and good-will towards men." The queen and the president of the United States exchanged congratulations. The American people were in a frenzy of enthusiasm, lauding the ocean telegraph as the greatest achievement of modern times, and giving unbounded praise to its heroic projector, the president of the United States and many distinguished persons on both sides of the Atlantic sending congratulatory messages to Mr. Field. But this enthusiasm was short-lived. For it was hardly three weeks before the cable began to mutter fitfully, and at last lay silent in the depths of the sea. Then ensued one of those revulsions of feeling so common in the history of all great enterprises, where at first success alternates with defeat. The public became almost ashamed of its late enthusiasm. Many doubted whether there had ever been a message across the ocean, and the whole subject became one for incredulity and ridicule. Three years after, the rebellion commenced, and it was difficult to get people in the United States to listen to commercial enterprises during the excitement of that great contest. But Mr. Field was not idle; he was constantly crossing and recrossing the Atlantic, and addressing chambers of commerce and public meetings in England and the United States, the results being that in 1864, the necessary capital was raised to renew the enterprise. A new cable was constructed, with all the improvements suggested by years of experience in submarine telegraphy, and coiled on board the *Great Eastern*, which was placed under the command of captain, now Sir James, Anderson. She sailed in 1865 with every prospect of success, paying out steadily about 150 m. a day. All went well till over 1200 m. had been laid, when in a sudden lurch of the great ship the cable was broken, and all were again in despair. For some days the gallant crew made attempts to pick it up from the bottom, but the sea was 2 m. deep, and with the resources at hand it was impossible, and the great ship took her way back to England. The attempt was abandoned for that year. But in the summer of 1866 it was renewed, and this time with complete success. The cable was laid from shore to shore, and the communication was perfect. As soon as this was completed the *Great Eastern* returned to mid-ocean, and began fishing for the cable lost the year before, and after weeks of effort succeeded in lifting it to the surface and joining it to 600 m. of cable reserved for the purpose, carried it safely to land. Thus two cables were laid the same year, both without a flaw, and from that time to the present telegraphic communication between the old world and the new has not been interrupted for a single day.

**ATLANTIS**, according to ancient tradition, the name of a vast island in the Atlantic ocean. It is first mentioned by Plato, who represents an Egyptian priest as describing it to Solon, but, of course, according to Plato's view of the matter. In this description, A. appeared as an island larger than Libya and Asia Minor taken together, and lying off the pillars of Hercules in the Atlantic ocean. Plato gives a beautiful picture of the interior of this imaginary land, and enriches it with a fabulous history. Some early writers supposed that the Canary islands were the remains of the old A.; for Plato had stated that at the close of the long contest which its inhabitants maintained against the Athenians, 9000 years before his time, the sea suddenly engulfed the island, and had ever since been unnavigable, by reason of the shoals of mud created by the sunken island. Some found it in the Scandinavian peninsula; others (first Bircherod in 1685) have supposed that Phœnician or Carthaginian merchant ships had been driven by storm on the coast of America, and that the supposed vast island of A. mentioned by Plato, as well as the great unnamed island spoken of by Pliny, Diodorus, and Arnobius, may have been the new world.

**ATLAS** is that piece of the human vertebral column which is nearest to the skull; in other words, it is the first cervical vertebra. It may be known from the other six by its being without a body or spinous process, by its being a mere irregular bony ring, partly divided into two unequal parts by a constriction; this division in the recent subject is completed by a ligament, the part in front being occupied by the tooth-like process of the second cervical vertebra, and that behind by the spinal marrow. On each side, the ring is very thick; it is smooth and cupped above to receive the condyles of the occipital bone. The corresponding parts below are flat, and rest on the second cervical vertebra.

The A., with the occipital bone forms the joint on which the head moves in bowing; and turns on the pivot of the second cervical vertebra, when we look from side to side.

**ATLAS**, according to Hesiod's *theogony*, one of the Titans, the son of Iapetus and Clymene, and brother of Menœtius, Prometheus, and Epimetheus. Apollodorus, however, states him to have been a son of Asia, and Hyginus, a son of Æther and Gaea. He married Pleone, daughter of Oceanus (or Hesperis, his own niece), and became the father of the Pleiades. As leader of the Titans, he attempted to storm the heavens, and

for this supreme treason was condemned by Zeus to bear the vault of heaven on his head and hands—the sting of this mythological punishment obviously being that A. was compelled to support what he thirsted to destroy. The later writers, however, rationalize the myth, and state that A. was a mighty king who had great skill in astronomy, and only tried to storm heaven intellectually.—In consequence of the ancient views which made the vault of heaven rest on solid pillars or other supports, the name A., originally mythological and cosmogonic, was introduced into geography. Mercator, in the 16th c., gave the name A., to a collection of maps; probably because the figure of A. supporting the heavens had been given on the title-pages of such works.

**ATLAS**, a mass of mountain-land in the western part of north Africa. Herodotus mentions a smoking mountain of this name situated on the s.w. of the Little Syrtis, and twenty days' journey westwards from the Garamantes, styled by the natives the "pillars of heaven." By later writers, after the time of Polybius, the name A. was always given to the chain of mountains in n.w. Africa extending from the island of Cerne (now cape de Ger) n.w. through Mauritania, and Tingitana (now Fez and Morocco), and including also the heights dispersed through the region of Sahara. It is divided into the Little Atlas and the Great Atlas; the former denominating a secondary range in the country of Sous, and the other, the loftier mountains of Morocco. The A. is not properly a mountain-chain, but rather a very irregular mountainous mass of land formed of many chains running in various directions, meeting in mountain-knots, or connected by yokes, or short chains of inferior height, and diversified still further by several solitary mountains and groups of mountains. The A. attains its greatest height (13,000 ft.) in Morocco, the only part where it rises above the snow-line, and obtains the name of Jebel-el-Thelj, or Snowy Mountains. Its highest peaks are Miltin—27 m. s.e. of the city of Morocco—Bibawan, and Tagherain. The most southern chain diverging here from the central mass bears the name *Jebel-Hadnar*. The heights approach the sea, and form the promontories jutting out into the Atlantic. From Morocco, the A. gradually decreases in height towards the east. In Algeria, the elevation is only 7673 ft.; in Tunis, 4476 ft.; and in Tripoli, 3200 ft. The whole mountain-system is intersected by the valley of the Mulua river, which flows through the n.e. part of Morocco, and falls into the Mediterranean. The slopes on the n., w., and s. are covered with vast forests of pine, oak, cork, white poplar, wild olive, etc. The valleys are well watered and capable of cultivation with great profit. The A. seems to be chiefly calcareous in its composition. The mineral wealth remains, however, almost wholly unexplored, though copper, iron, lead, antimony, etc., are stated to exist in abundance.

**ATLEE**, WASHINGTON L., b. 1808; a physician and surgeon of Pennsylvania, graduate of Jefferson medical college, and professor of chemistry there in 1844. He is the author of a great number of medical papers, and is distinguished for success in ovariotomy.

**ATMOSPHERE** (Gr. *atmos*, vapor, *sphaira*, sphere) is the name applied to the gaseous envelope which surrounds the earth. The existence of an A. is to us a matter of vital importance. We owe to its influence the possibility of animal and vegetable life, the modifying and retaining of solar heat, the transmission of sound, the gradual shading of day into night, the disintegration of rocks, and the occurrence of weather phenomena. In consequence of the action of gravity, the A. assumes the form of a spheroidal stratum concentric with the earth, and presses heavily on its surface. It exhibits, in common with all fluid bodies, the usual characteristics of hydrostatic pressure, but its internal condition differs from that of a liquid inasmuch as its particles repel each other, and can only be held in proximity by external force. From this circumstance, it follows that the volume of any portion of air varies much more under the influence of external pressure than that of an equal volume of water; hence, the stratum of air nearest the earth is denser than strata in the upper regions, where, from their being subjected to the weight of a smaller mass of superincumbent air, the repulsive force of the particles has freer play.

That air possesses *weight*, is illustrated by the following simple experiment: If a hollow glass globe of 5 or 6 in. in diameter be weighed first, when filled with air, and then, after the air has been extracted from it by means of the air-pump, it will, when thus exhausted, weigh sensibly less than it did before, and the difference of the two results will represent the weight of the quantity of air which has been withdrawn. It has been determined by Biot and Arago that 100 cubic in. of dry air, when the barometer is at 30 in., and the thermometer at 60° Fahr. weigh 81.074 grains. The law of Archimedes (see ARCHIMEDES, PRINCIPLE OF), that a body immersed in a fluid loses a part of its weight equal to the weight of the volume of fluid displaced by it, finds its application in the A. as well as in water. If a glass globe filled with air and closed be suspended at the extremity of the beam of a delicate balance, and be kept in equilibrium by a brass weight at the other extremity, and if the whole be then placed under the receiver of an air-pump, and the air extracted, the equilibrium previously existing in air will be disturbed, and the larger body will become the heavier. The reason of this is, that when first weighed, they each lose as much of their own weight as that of the respective volumes of air displaced by them, and are therefore made buoyant, though in different degrees, the ball with the larger volume having the greater buoyancy. In a vacuum, they

are deprived of this buoyancy, and the larger body, suffering the greater loss, becomes sensibly heavier than the other. In like manner, a balloon filled with heated air or hydrogen gas is lighter than the volume of air displaced by it. It is therefore forced upwards till it reaches a stratum of such density that the weight of the volume of air there displaced by it equals the weight of the balloon itself. In this stratum it will remain poised, or move horizontally with the currents to which it may be exposed.

In endeavoring to determine the *form* of the atmospheric envelope, it is necessary to bear in mind that, according to the law of fluid-pressure, in order to produce a state of equilibrium at the level of the sea, the pressure of the A. must be equal at that level over the whole of the earth's surface. Gravity acts with less force on the air at the equator than on that at the poles, in consequence of the spheroidal form of the earth. It has there, in addition, to contend with the centrifugal force, which entirely fails at the poles, and which has a tendency to lighten the air by acting contrary to that of gravity. Hence we infer, that in order to produce the same pressure at the level of the sea, the atmospheric height at the equator must be greater than that at the poles, and that the A. must therefore possess the form of an oblate spheroid, whose oblateness is considerably greater than that of the earth itself. The greater heat at the tropical regions must also have the effect of increasing the oblateness.

The *height* of the A. has not yet been determined. That it must have a certain limit, is evident from the consideration that there must be a point at which gravity on the one hand, and centrifugal force and the repulsive action of the particles on the other, are poised, and beyond which, the latter forces overbalancing the former force, the aerial particles would be borne away from the earth. As, however, the law of the diminution of temperature, which materially affects the repulsive action, is unknown for the upper regions of the air, it is impossible to calculate the height of the atmosphere from the relations of these forces. From the observation of luminous meteors, it is inferred that it is at least 100 m. high, and that, in an extremely attenuated form, it may even reach 200 miles.

The *pressure* of the A. is one of its most important properties. Its effect is exhibited in the action of the ordinary water-pump. The piston is fitted air-tight in its cylinder; and on being drawn up, creates a vacuum. The water within the pump being thus freed from pressure, while that outside of it is exposed to the pressure of a column of air reaching to the surface of the A., is at once forced up by reason of the weight of air which it must rise to balance. The ascent of the water takes place till the piston has reached the height of nearly 34 ft., from which we conclude that a column of air is equal in weight to a column of water of the same horizontal section, and of the height of nearly 34 feet. As mercury is 13.6 times heavier than water, a mercurial column freed from atmospheric pressure at the one extremity, and subjected to it at the other, is 13.6 times less in height than the column of water, or about 30 in. From the more convenient size of this column, mercury has been adopted as the standard for atmospheric pressure, and is employed in our ordinary barometers (q.v.) A mercurial column of 30 in. in height, and 1 sq.in. in section, weighs 15 lbs. (more accurately, 14.73), which gives us the equivalent weight of a column of atmospheric air of the same section. The word A. is often employed to express this weight or pressure on a sq.in. of surface, so that when we speak, in mechanics, of the pressure of steam on a boiler as amounting to three atmospheres, we mean a pressure of 45 lbs. on the sq.in. The pressure on a sq.in. being thus ascertained, we have merely to multiply it by the number of sq.in. on the earth's surface to obtain the total weight of the A. It amounts to 11.67085 trillions of lbs., or about ~~11.67085~~ of the earth's mass. It must be observed that the height of the barometric column is not a constant quantity, as it varies with the latitude, the season of the year, and the hour of the day. At London, its mean height is 29.88 in.; at Paris, 29.92 in. The pressure of the A. in the northern hemisphere increases as we recede from the equator, reaching a maximum at 30° n. lat., and decreasing from 30° to 65°, where it again begins to rise. The greater height at 30° is said to be due to the accumulation of air at that latitude by the action of the trade winds. As the heat of the earth's surface increases the rarity of the air above it, and causes the air at the top of the heated column to overflow, we would expect that, during the year, the barometer would stand at a minimum in summer, and a maximum in winter. In reality, however, although the barometer is highest in midwinter, there is another maximum in midsummer, making thus two minima—one in spring, the other in autumn. This arises from the part which watery vapor plays in the pressure of the atmosphere. The heat of midsummer introduces into the air a large quantity of moisture, in the form of elastic vapor, which, adding its pressure to that of the dry air, raises what would otherwise be the minimum barometric column to a higher point than that at which it stands in spring and autumn. Similar causes affect the pressure of the A. during the 24 hours of the day. There are two maxima—one at 10 A.M., the other between 10 and 11 P.M.; and two minima—at 4 A.M. and 4 P.M. Very slight variations indicate the existence of atmospheric tidal waves; but this subject is still involved in some obscurity. The pressure of the A. exercises a most important influence on the organism of the human frame. A man of ordinary stature is exposed to a pressure of about 14 tons; but as the air permeates the whole body, and presses equally in all directions, no inconvenience is found to result.

from it. From experiments instituted by the brothers Weber in Germany, it has been ascertained that the heads of the thigh and arm bones are kept in their sockets by the pressure of the A.; and in balloon ascents the aeronaut often suffers from bleeding at the nose, lips, and even eyes—a fact that would seem to indicate that the strength of the blood-vessels has been adjusted with reference to atmospheric pressure.

*Chemical Composition of the A.*—Recent chemical researches give the following as the mean composition of 100 volumes and of 100 grains of dry air:

	Volumes.	Grains.
Nitrogen.....	79.02	76.84
Oxygen.....	20.94	23.10
Carbonic acid.....	0.04	0.06
	<hr/> 100.00	<hr/> 100.00

Besides the substances just named, other gaseous matters occur, but in quantities so small as not sensibly to increase the bulk of the A., such as ammonia and ammoniacal salts, carbureted and sulphureted hydrogen, carbonic oxide, sulphurous and sulphuric acid, nitric acid, and perhaps iodine, the quantity and even the presence of which are affected by local and meteorological causes. Roughly speaking, then, dry air may be said to consist of 4 volumes of nitrogen and 1 of oxygen, with a slight admixture of carbonic acid, and a mere trace of several other substances. As, however, the air of the A. is never found dry, we must add to the constituents already named watery vapor, the amount of which is constantly changing, according to locality, weather, wind, and temperature. It is stated that of 1000 grains of atmospheric air, the proportion due to aqueous vapor varies from a minimum of 4 to a maximum of 16 grains. By far the most active chemical constituent of the A. is oxygen, to the agency of which are owing the existence of animal life, the maintenance of combustion, the rusting of metals, and the occurrence of several other chemical phenomena too numerous to be detailed. A small portion of this oxygen occurs in the form of ozone (q.v.), a modification which, according to recent chemical discoveries, plays an important part in the chemistry of the A. The nitrogen which forms the bulk of the A. possesses few chemical properties of importance, but performs the important part of diluting the oxygen, which, if it occurred alone, would act with too great intensity. The presence of carbonic acid in the air is shown by the production of the white carbonate of lime in lime-water freely exposed to its influence. Carbonic acid is produced in all processes where carbonaceous matter unites itself with the oxygen of the air, such as in animal respiration, in combustion, in fermentation, in putrefaction, and similar processes. The green leaves of plants, on the other hand, possess, in presence of sunshine, the power of decomposing carbonic acid into its elements, absorbing the carbon for their own tissues, and restoring the oxygen to the A. in its original purity. Between the processes above mentioned, on the one hand, and the action of plants on the other, the quantity of carbonic acid in the air is kept nearly constant. From the table it will be seen that 10,000 volumes of atmospheric air contain 4 volumes of carbonic acid. If it occurred in a much larger proportion, being poisonous, it would become dangerous to animal life; and if it occurred in a much less proportion, the vegetable world would lack its requisite nourishment. The other substances, of which a trace is always or only sometimes found in atmospheric air, are difficult to detect in the air itself, but are generally found dissolved in rain-water, more especially in that which has fallen immediately after a long drought. Of these, by far the most important and widely diffused are ammonia and ammoniacal salts, which are of essential importance to the vegetable economy, because, dissolved in the rain, they furnish plants with the nitrogen required by them for the production of their flowers and fruit. Nitric acid is detected in the air after thunder-storms, sulphureted hydrogen in the tainted air of sewers and such like places, and sulphurous and sulphuric acid only in the neighborhood of chemical or smelting works. A considerable quantity of carbonic oxide and carbureted hydrogen escapes unconsumed from our furnaces; and although the latter gas is in addition given off to the air in marshy and bituminous districts, the two occur in almost inappreciable quantity in the atmosphere.

In addition to its gaseous constituents, the A. contains solid substances in a state of exceedingly fine division, the presence of which is revealed in the sunbeam. Many of these minute particles, being the seeds or germs of plants and animals, must exert an important influence on the organic substances on which they may finally settle, inducing in many of them the conditions of disease or putrefaction.

When the composite nature of the A. was first discovered, it was supposed to be a chemical combination of nitrogen and oxygen, but further inquiries have rendered this opinion highly improbable. When any two bodies unite with each other chemically, the substance which results from their combination invariably possesses properties which the original constituents did not possess. Now the atmospheric union of oxygen and nitrogen is distinguished by no properties which may not be attributed individually to these gases. We have, then, in this respect, no indication that the atmospheric combination of oxygen and nitrogen is a chemical one. Again, when any composite gas is dissolved in water, the proportion of the ingredients dissolved in it is exactly the same as that in which they occur in the compound itself; but this is not the case with air dis-

solved in water, which is found to be richer in oxygen than atmospheric air. Now, as oxygen dissolves more readily in water than nitrogen, it is manifest that this larger proportion of oxygen arises from both gases acting independently of each other in respect to the water, a condition that would be impossible if they were in chemical union. From these and other corroborative facts, the A. is considered to be simply a mechanical combination of the gases contained in it. This, however, does not prevent the A. from having a uniform composition, as might at first sight be supposed; for when gases are mixed with each other, they intermingle thoroughly throughout the whole space occupied by them. Local causes may temporarily affect the relative proportion of the atmospheric ingredients, but the changes are so minute as to require the most delicate analysis to detect them.

**ATMOSPHERIC ELECTRICITY.** Franklin was the first to establish the identity of the lightning of the heavens with the electric spark. By his famous kite-experiment, he ascertained that the thunder-cloud assumes an electrical condition precisely similar to that of the conductor of an electrical machine, and that the same mechanical and luminous effects are common, though in a different degree, to both. The attention that was first directed by this discovery to the A. E., as displayed in the thunder-cloud, has since then been extended to the electrical condition of the air in all the different states of the weather. It is now found that the air is sensibly electrical not only when the sky is overcast with thunder-clouds, but when the weather is clear, or when no thunder-clouds are present. Observations on A. E. are made by delicate electrometers connected with insulated rods at the top of the building, or other collecting apparatus. The following are some of the results got by continental observers: When the sky is clear and free from clouds, the A. E. is always positive, and an electroscope exposed to the action of the air is charged with positive electricity. On the other hand, the electricity of the ground is found to be negative. This was shown in a very ingenious way by Volta, who, by catching the fine spray of a fountain on the plate of a straw electroscope, found the straws to diverge with the negative electricity communicated to them by the water, which was necessarily of the same character as that of the ground. It is from this fact that electroscopes, or the collecting apparatus connected with them, must not be overtopped by the neighboring trees or buildings, the negative electricity of which materially affects the indications given, and it is due to the same fact that no A. E. is discovered in the middle of a wood, or in a room, however high the ceiling. Under a clear sky, the potential of the A. E. is found to increase as we ascend, the lower aerial strata being less electrical than the higher. Becquerel proved this by a simple experiment on the plateau of Mt. St. Bernard. On a piece of oiled silk he placed a silk thread, covered with tinsel, one end of which, terminated by a ring, was connected with the rod of a straw electroscope, and the other end was tied to an arrow armed with a metal point. When the arrow was shot horizontally, the straws showed no divergence; but when the arrow was shot upwards, they opened as it ascended, and diverged most when the arrow, in ascending, disengaged the ring from the rod of the electroscope. The same fact is shown in the following way: When a very delicate electroscope is adjusted for any particular position, it will, when elevated a few feet above that position, give indication of positive electricity, and when placed a few feet below, it will be charged negatively. In clear weather, likewise, the A. E. is found to be subject to certain daily periodical variations, and appears to have two maxima and two minima in the course of twenty-four hours. The first maximum takes place a short time after sunrise, and the second shortly after sunset; the first minimum shortly before sunrise, and the second in the afternoon, when the heat of the day is greatest. In cloudy weather, the electroscope is affected sometimes positively, sometimes negatively, and is generally less influenced than in clear weather. The electricity of rain, snow, hail, etc., is sometimes positive, sometimes negative. In Stuttgart, for instance, it was found in the course of a year that the rain was 71 times positive to 69 times negative, and the snow 24 times positive to 6 times negative.

Sir William Thomson, in our own country, has made various observations on atmospheric electricity. His delicate electrometers give him not only great facility of observation, but their delicacy far transcends that of any instrument hitherto employed in such observations. Instruments such as his electrometers, that are sensitive to the electro-motive force of a single Daniell's cell with any condensing contrivance, are a wonderful advance in observing power. Sir William's collecting apparatus is an insulated can of water placed inside a window, with a nozzle extending four feet and a half beyond the wall, the window being only open so far as to admit of the nozzle-tube passing without touching. The can, when the stop-cock is opened, assumes the potential of the air outside at the point where the jet breaks up into drops. In the portable electrometer for outside observations, he uses as the collector a burning match at the top of a long rod attached to the instrument. The collecting apparatus is, of course, insulated and connected with the electrometer. He estimates the amount of atmospheric electricity per foot or per inch. He calculates the difference of potential at the perpendicular distance, say, of a foot from any portion of the earth's surface, whether the level ground or an upright wall. He finds, as mentioned above, that the earth is always negative in clear weather, and the air positive, and that the difference of potential per foot is very different at different times. Thus, in the isle of Arran, he found this to vary in ordinary fine

weather from 22 to 44 Daniell's cells; with an e. or n.e. wind, the difference of potentials was from 6 to 10 times that per foot. He also finds sudden and unaccountable variations of potential within even comparatively few minutes, and he can only suggest that there may be cloudless yet cloud-like masses of clear air floating in the atmosphere, which are charged with electricity, and which, in their passage over or near the electrometer, give rise to these marked variations.

The cause of A. E. has given rise to much discussion. The electricity developed by evaporation and vegetation has been thought by some to account for the positive electricity of the air; but this view has been combated, and as yet no theory has been proposed which satisfactorily accounts for it. With the instrument that Sir William Thomson has placed in the hands of observers, and with a cordon of observers all over the world, data may be got for a satisfactory theory, but as yet our knowledge of the subject is too fragmentary to reach anything like a satisfactory account of it. For the electricity of the thunder-cloud, see LIGHTNING.

**ATMOSPHERIC ENGINE**, worked by air-pressure; one was driven by cold air on a small, and hot air on a large piston; one was without heat (see CALORIC ENGINE). The A. E. is now worked with compressed air only. Trains on a city railway have been run with an A. E., using air compressed into a strong cylinder and applied like steam in a steam-engine. Condensed steam is used in a similar way, so as to dispense with fire on the streets; in either case the power is taken at a fixed station. An A. E. was used in the mont Cenis tunnel, where the hydraulic power of a cataract near the entrance was used to compress air in reservoirs, whence it was carried in flexible pipes to the rock-drills. The same method was used in working the Hoosac tunnel, in Massachusetts, and is now commonly applied for railway and mining works. The mechanism and operation of the A. E. are almost identical with those of the high-pressure steam-engine.

**ATMOSPHERIC INFLUENCE**, the power of the air over inorganic bodies to affect them chemically, varying in degree with the constituents and condition of the air itself. Normally, 1000 parts of the air contain 208 parts of oxygen and 792 of nitrogen; but many other gases are taken up, so that the air varies widely at places not far apart. Electricity, humidity, and temperature are other disturbing agents. The effect of A. I. is shown on buildings, many fine structures having been speedily ruined by it. Granite, in its order of purity, best withstands it among building stones. Egyptian porphyry is also remarkably enduring. Basalt is disintegrated unequally, according to the amount of feldspar therein. The atmosphere of large towns usually contains an excess of carbonic acid gas, and is hurtful to turpentine in timber or other material. Slate is durable in proportion to its density. Sandstone, millstone grit, or conglomerates are affected through the decomposition of the material cementing their particles, or by the mechanical effect of moisture, as by freezing. Limestone decays with varying degrees of rapidity. A. I. on bricks, tiles, etc., depends on the chemical composition of their material and the amount of baking or burning in their manufacture. If bricks contain lime, they will crack and crumble under moisture. In making cements, the A. I. is carefully studied and guarded against by a proper selection of materials. All timbers are affected easily. If moist and exposed to currents of air, evaporation is rapid and cracks are produced by shrinkage. Dry-rot comes from exposure to high temperature, and consequent imprisonment of natural moisture. Common wet rot is well known to come from air and water combined. The influences of both are greatly lessened by covering the wood with oil paint. Kyanizing, creosoting, and pickling in mineral salts are methods of protecting wood. On metals A. I. is complicated by electro-chemical changes. Iron becomes rusty, that is, the surface is converted into hydrous oxide and will scale off. The more iron is used the less the rusting, as may be seen on comparing a well-worn railway track with a little used siding. Zinc when exposed to air and moisture is rapidly covered with white oxide of zinc, a coating which arrests further oxidation. For this reason, also, galvanizing or plating with zinc is a means of protecting iron. Copper strongly resists A. I.; like zinc, it is soon covered with an oxide that serves as a protection. Lead changes but little in air or water. Glass which is deficient in silica is exposed to decay by the decomposition of its potash and soda. The A. I. causes decay of paintings, statuary, and other works of art, and the destruction of books and manuscripts.

**ATMOSPHERIC RAILWAY**, a railway on which the locomotive-power is supplied by the pressure of the atmosphere more or less directly on the carriages themselves. The idea of producing railway locomotion in this manner has been successively prosecuted by Lewis, Medhurst, Vallance, and Pinkus; and latterly with a greater prospect of success by Clegg, in connection with Samuda. Vallance patented a plan which proposed the conveyance of passengers along a railway laid within an air-tight tunnel exhausted in front of a carriage working as a piston, the pressure of the atmosphere acting on the carriage from behind. This plan was made public in 1825, and ultimately brought into experimental operation at Brighton, proving the possibility of such a mode of transit. The general opinion as to its merits was, that though it might succeed in the transmission of goods, or, with a smaller tube than the tunnel, might suit well the conveyance of the mails, it could not be expected to enjoy the favor of the traveling public, on account of

its dark close tunnel. Thus the subject of atmospheric railways had ceased to attract attention, when the curiosity of the public was again called to it, by the proposal of another plan of propulsion, by Henry Pinkus, an American gentleman, resident in England, who took out a patent for it about the year 1835, under the name of the pneumatic railway. The apparatus for this was to consist of a cast-iron tube of about 40 in. diameter, having a slit of about 2 in. wide on its upper side, the slit (which was covered by a flexible flap or valve) furnishing an opening through which the mechanism of a piston working within the tube might be connected with that of the leading carriage without.

Under improved arrangements of the details, Messrs. Clegg and Samuda made an experiment of this plan in 1840, on a part of the line of the West London railway; and so favorable was the issue, that the directors of the Dublin and Kingstown railway adopted the atmospheric pressure system for a projected extension of their line from Kingstown to Dalkey. Accordingly, parliamentary sanction was obtained for the line, and the first A. R. was in full operation at the beginning of the year 1844. In that year the London and Croydon railway company began to lay down a line of A. R. alongside of their locomotive line from London to Croydon. The South Devon railway company also adopted the atmospheric mode of working on a part of their railway. Both of these lines, however, were shortly afterwards abandoned as unsatisfactory.

The result of these trials has clearly shown that the A. R. system cannot stand in competition with that of the locomotive engine, unless, perhaps, in some very peculiar situation. The expense and care necessary to keep the tube with its valve in good working-order, led to the removal of the atmospheric mechanism from the various railways on which it was established; so that the history of A. R. may be ranked under the chapter of failures. They survive only in the form of pneumatic dispatch tubes, which are used largely in London (in connection principally with the telegraph service), for the conveyance of parcels or messages for short distances.

**ATOLL'**, the name given by the Malays to a coral reef which forms an annular island, inclosing a lake of water which is connected with the sea by an open strait. Some A. are nearly 100 m. in circumference, and have from 15 to 60 fathoms of water. They make excellent harbors, with safe entrances, always on the windward side. Some of the reefs sustain considerable vegetation, and are inhabited.

**ATOM** (Gr. *atomos*, an indivisible particle; from *a*, not, and *temnō*, I cut). In ancient philosophy, two theories of the nature of matter were recognized, and these have continued to form subjects of argument among speculative men since the year 510 B.C. to the present time. The one theory is that matter is infinitely divisible. Thus, a needle may be divided into two, and each of the parts may in its turn be broken or cut into two, and each of the latter again and again be subdivided, till the parts become so small that it may be impossible to see them by the naked eye; but these parts are regarded as capable of still further division, without limit or stoppage, provided more perfect or delicate means could be employed to act upon them. The second theory regarding the constitution of the matter is that in the repeated division and subdivision of a solid, liquid, or gas, a point will be at length reached when it will no longer be possible, by any conceivable means, to break a molecule in two, the molecule being a real unity, not composed of separate parts—in other words, an *atom*. The latter theory recognizes the finite divisibility of matter, and considers that all matter is more or less compactly built up of myriads of atoms aggregated together, and having spaces or pores between the several atoms or particles. If it were possible to subject such matter to the scrutiny of a sufficiently powerful magnifying-glass, or microscope, and thus exhibit or behold the atoms so separated by spaces, then an appearance would be presented similar to that which the painter chooses to depict on the canvas when he is representing a snow-storm, and where every little flake of snow is separated from its neighbor one by a space in which there are none; or that which would be observed if, during a hail-storm, some great power were to cry, "Halt!" and that instant every minute hail-stone was arrested in the spot it had reached.

This view of the physical nature of matter is that which is known as the *atomic* or *corpuscular theory*, and has in modern times received some support from the facts embodied in the chemical atomic theory originated by Dalton. Granting, however, that the chemist can prove that his simple and compound forms of matter are built up of chemical atoms, the problem still remains to be solved as to the possible identity of physical and chemical atoms. What the chemist regards as an A. in his science, may not be an ultimate and indivisible A. in a physical point of view; the chemical A., though incapable of division as a chemical A., may still be composed or built up of many physical atoms, and may be capable of being subdivided into such. Indeed, whilst the atomic theory of Dalton, when first announced, was eagerly seized upon as the best possible evidence for the existence of both chemical and physical atoms, the tendency of recent researches and discussions in chemistry has been to show that the chemical A. is different from the physical, and does not necessitate the existence of the latter. See **ATOMIC THEORY**. According to the ordinary acceptance of the term, it is a molecule of matter having a definite weight, magnitude, and form, possibly alike for the atoms of the same material, but differing in those of

different substances. The form of an A. is supposed by some men of science to be the same as that which the fragments of a substance assume when it is split in the direction of the planes of the cleavage of its crystals (see CRYSTALLOGRAPHY), but a more general belief has been that all atoms are spherical, and that the various crystalline forms are produced by the manner in which the atoms are grouped together. In regard to the size of atoms, Sir William Thomson has shown, by three entirely different trains of argument from observed facts, that the diameter of an A. cannot be greater than  $\frac{1}{150,000,000}$ , nor less than  $\frac{1}{5,000,000,000}$  of an inch. Further considerations regarding atoms will be found under the head Matter (q.v.); also in the article Vortex (q.v.).

**ATOMIC THEORY.** Analysis shows that compound bodies contain certain elements (see CHEMISTRY) in certain proportions. These proportions have been minutely and carefully examined by many chemists since the time when the balance was first applied to chemical investigation, and it has been proved that the respective quantities of each of the combining elements are not dependent entirely upon external conditions, but are regulated by certain laws. These laws were partially observed and discussed by earlier chemists and physicists, but it was reserved for Dalton (q.v.) to systematize the somewhat incoherent labors of his predecessors, and to announce, in positive language, the four laws which regulate the union of various kinds of substances, and which are still acknowledged by chemists as the LAWS OF COMBINING PROPORTION, or the atomic theory. These laws regulate the combination of unlike substances by *weight*, and not by *volume*; and they are based upon the preliminary acknowledged fact, capable of experimental demonstration, that the same compound substance is always composed of the same ingredients or elements.

The *first law* of combination by weight comprehended under the A. T. is THE LAW OF CONSTANT PROPORTION, which teaches that the elements or ingredients which form a chemical compound are always united in it in the same proportion by weight. Thus, water, which consists of oxygen and hydrogen, does not contain one or both of these elements in indefinite amount, but it is invariably made up of 8 parts by weight of oxygen to 1 part by weight of hydrogen. It makes no matter whether the total amount of either element be represented by grains, ounces, pounds, or tons, it will always be found that the proportion of 8 parts of oxygen to 1 part of hydrogen is kept up. Neither does the source of the water make any difference, for pure water obtained from rain, snow, or hail, the river or the sea, the sap of plants or the juices of animals, invariably contains the same elements in the same proportions. Again, common salt (chloride of sodium), whether it be obtained from sea-water, salt-springs, rock-salt, or even the blood of animals, always consists of chlorine and sodium in the exact and never varying proportion of  $35\frac{1}{2}$  parts of chlorine to 23 parts of sodium. Whilst the law of constant proportion teaches us that the same compound is always built up of the same ingredients in the same proportion, it does not necessarily follow that the same elements or components in the same proportions will invariably form the same compound body. It is far otherwise; and many examples can be obtained, especially from organic chemistry, where the same components in the same proportions produce very different substances. Thus, starch and cotton (lignine)—very dissimilar substances—consist of carbon, hydrogen, and oxygen in the very same proportions; and gum-arabic and cane-sugar are similarly circumstanced. See ISOMERIC BODIES.

The *second law* is the LAW OF RECIPROCAL PROPORTION, which tells us that the proportions in which two substances unite with a third have a simple arithmetical relation to that proportion in which they unite with each other. Thus oxygen and hydrogen unite in the proportion of 8 to 1 to form water. Carbon and hydrogen are present in olefiant gas in the proportion of 6 to 1, and oxygen and carbon unite in the proportion of 8 to 6 to form carbonic oxide. Again we have a compound of oxygen and iron containing these elements in the proportion of 8 to 28; we have also a compound of sulphur and iron in the proportion of 16 to 28; and sulphur and oxygen unite together to form sulphurous acid gas, which contains equal weights of the two elements—the proportion of 1 to 1 having a simple arithmetical relation to the proportion 8 to 16.

Numbers representing the proportions in which the elements combine (such as 1 for hydrogen, 8 for oxygen, 6 for carbon, 16 for sulphur, 28 for iron, etc.), are called their "combining proportions," or *atomic weights* (q.v.). It is obvious that analysis alone cannot enable us to fix definitely such numbers. There is nothing in the composition of their compounds to lead us to adopt the proportional numbers given above for hydrogen, oxygen, carbon, sulphur, and iron, rather than simple multiples or sub-multiples of them. In fact, the numbers adopted by Berzelius, and now reintroduced, are in the proportion—hydrogen 1, oxygen 16, carbon 12, sulphur 32, iron 56. The reasons for preferring certain particular numbers to any multiples or sub-multiple of them will be found in the article CHEMISTRY.

The *third law* is THE LAW OF MULTIPLE PROPORTION, which is, that when one substance combines with another in several proportions, the higher proportions are multiples of the first or lowest. Thus, hydrogen unites with oxygen in two proportions: as 1 of hydrogen to 8 of oxygen, when ordinary pure water is the result of union; and as 1 of

hydrogen to 16 of oxygen, when peroxide of hydrogen, a powerful bleaching agent, is produced—the difference in the respective amounts of the oxygen—8 and 16—being that the latter is a multiple of the former by 2. Again, carbon unites with oxygen in two proportions: as 6 of carbon to 8 of oxygen, when the inflammable gas, carbonic oxide, is formed; and as 6 of carbon to 16 of oxygen, when the non-inflammable gas, carbonic acid, is the result. The variation in this instance is, that the oxygen is present in the one case as 8, and in the other as a multiple of that number by 2, viz. 16. One of the best illustrations of this law occurs in the case of the union of nitrogen and oxygen: 14 parts of nitrogen can unite with 8 of oxygen, and thus form laughing-gas; but the same amount of nitrogen can combine with 16, 24, 32, or 40 of oxygen—in the latter case constituting anhydrous nitric acid—all of the higher numbers being multiples of the first or lowest, viz. 8 by 2, 3, 4, and 5.

The *fourth law* is THE LAW OF COMPOUND PROPORTION, which teaches that the combining proportion of a compound substance is the sum of the combining proportions of its components. Thus, the compound body, carbonic acid, which consists of 6 of carbon united with 16 of oxygen, has the combining proportion 22, which is the sum of the combining proportions of the carbon and oxygen composing it, viz.  $6+16=22$ . Similarly, the compound substance lime contains 20 of the metal calcium combined with 8 of oxygen, and has the combining proportion of  $20+8$  or 28. When carbonic acid and lime are linked together, as in marble, which is the carbonate of lime, then they are united in the proportion of 22 parts of carbonic acid and 28 of lime. Not only is 22 the proportion in which carbonic acid will combine with lime, but it is the proportion in which it will form compounds with every other substance of similar chemical constitution.

The preceding laws regulating the union of substances by weight have been obtained by comparing together the results of numerous experiments, and every careful analysis serves to confirm their accuracy. But Dalton's theory was not limited to the statement of these laws; it was also an attempt to explain them. It assumes that each elementary substance consists of extremely small indivisible particles or atoms; that the atoms of any one element are all exactly alike, but differ from the atoms of every other element. Among other points of difference, they differ in weight, and although the absolute weight of an atom is unknown, the weights of two atoms, one of one element, the other of another element, are in the proportion of the combining weights of the elements they belong to. Thus the combining weight of sulphur is twice that of oxygen: we do not know the absolute weight of an atom of either, but the A. T. assumes that each atom of sulphur is twice as heavy as an atom of oxygen. Further, Dalton's theory assumes that the ultimate particles of compound bodies contain a comparatively small number of atoms of the component elements. It is easy to see how this theory explains the laws enunciated above. We must, however, remember that while the theory satisfactorily explains the laws, the laws do not prove the theory. It is quite conceivable that such laws might exist, although matter did not consist of atoms. The A. T., however, rests not only on a chemical but also upon a physical foundation. According to the modern molecular theory, matter consists of small particles, each of which is in motion, and this motion is the more rapid the hotter the substance is. These small particles or "molecules" cannot be broken up without changing the character and properties of the substance. They are not, however, *atoms*. In the case of compounds, as the molecules of any *one* substance are all similar to one another, each molecule must contain all the components; and in many elementary substances it can be proved, assuming the truth of the molecular theory, that each molecule consists of several similar atoms. A molecule, then, is either a single atom, as in *some* elementary substances, or a group of atoms which remain together during those movements which depend on the temperature of the substance. Now, the velocity of these motions increases as the temperature is raised; when, therefore, the temperature is raised so high, and the velocity of the molecules becomes so great that the collision of the molecules with one another is sufficiently violent to break them up and separate their constituent atoms, the substance is decomposed, the atoms rearranging themselves into new groups (or molecules) capable of remaining unbroken under the new conditions. This explains the decomposition of compounds by the action of heat.

When the temperature is not so high, and the violence of collision insufficient to break up the molecules, these are merely shaken, thrown into a state of vibration, and thus the hold of the atoms upon each other is loosened. Now, if two substances are mixed together, it may happen that some atoms in the one set of molecules are so attracted by some atoms in the other set, that, when a molecule of the one set meets one of the other set in a vibrating or loosened condition, an exchange of atoms may take place between them, or each may lose a part of its atoms, these going to form a new molecule. This gives an explanation of the action of one substance upon another, and further shows why, in general, a certain temperature is required in order that the action may take place.

Gay Lussac first pointed out that a relation exists between the density of a gas and its atomic weight. Avogadro greatly simplified the statement of these relations by announcing the law of molecular volumes of gases, a law which prof. Clerk Maxwell has since proved to be a necessary consequence of the molecular theory of gases. This

law is, that a given volume of gas at a given temperature and pressure contains the same number of molecules whatever be the nature of the gas.

From this law, to which we may give the name of "Avogadro's law," and from Boyle's law, and the law (often called Charles's law) that the volume of a gas is directly proportional to the absolute temperature—that is, to its temperature reckoned from a point 273° centigrade below the freezing-point of water—it follows that the volume occupied by a given mass of a gas is a function of the pressure, the temperature, and the molecular weight of the gas; understanding by the "molecular weight" of a substance a number  $M$ , such that  $M:2::$  the absolute weight of a molecule of the substance: the absolute weight of a molecule of hydrogen. The number 2 appears in this proportion because we assume the *atom* of hydrogen as our unit, both of atomic and of molecular weight, and it can be proved (see CHEMISTRY) that the molecule of hydrogen gas consists of two atoms. If, then,  $P$  be the pressure in millimeters of mercury at 0° C;  $t$ , the temperature of the gas, as indicated by a centigrade thermometer;  $M$ , the molecular weight of the substance; and  $V$ , the volume (in cubic centimeters) occupied by a gramme of the gas,  $V = \frac{760}{P} \times \frac{t+273}{273} \times \frac{22400}{M}$ . In the gaseous state,

the average distance between the molecules, although extremely small, is great compared with the size of the molecules, so that the volume of the gas depends almost exclusively upon the distance between the molecules: it is not so in the case of solids and liquids, in which the molecules are so closely packed as to be almost always in contact. The volume occupied by solids and liquids depends, therefore, far more upon the *atoms* of which the substance is made up, than upon its *molecular* structure. For further recent modifications of the atomic theory, see CHEMISTRY.

**ATOMIC VOLUMES.** See ATOMIC THEORY above, and CHEMISTRY.

**ATOMIC WEIGHTS** are the proportions by weight in which the various elementary substances unite together. It is necessary that one element be selected as the starting-point of the series, and an arbitrary sum affixed to it, and thereafter all the other elements can have their sums awarded to them, according to the proportional amounts in which they combine with each other. The *second law*, mentioned under the Atomic Theory (q.v.), explains the manner in which this can be done, and how far the numbers are arbitrary. In all systems of atomic weights in modern use, the atomic weight of hydrogen is taken as unity, and the atomic weights of the other elements are then fixed, so as to give on the whole the simplest and most consistent formulæ for their compounds.

There are two systems of atomic weights at present in use. 1st, The "old" system, which, after a good deal of discussion, was generally adopted about 1845; and 2d, The new system, which is, in many respects, a revival of the system of Berzelius, and which may be said to have come into general use by scientific chemists about 1830.

The subjoined table gives the names of the elements, their chemical symbols, and their atomic weights, according to these two systems. The reader is referred, for the reasons for the change of atomic weights, to the article CHEMISTRY.

ATOMIC WEIGHTS (*ante*). See CHEMISTRY, and ELEMENTS CHEMICAL.

**ATONEMENT.** Sin violates the ground of union which the personal creature has, by nature, with the holy God. The act of sin is one of separation; the act begets the state of sin, the state confirms and repeats the act. The doctrine of the A. treats of the mediation necessary for restoring the union between God and man, which has been lost by sin. The A., therefore, must ever be the fundamental doctrine in every religion of sinful creatures. In the Christian religion, it manifestly occupies this central position: for the Christian doctrine of the A. is but the explanation of its great historic fact—the embodiment in one person of the divine and human natures in perfect agreement. In the person of Christ, God and man are atoned: he is their atonement.

So fundamental is the doctrine of the atonement in the Christian religion, that it does not, like many other doctrines, form a ground of distinction among the different bodies into which the Christian world has been divided. All churches may be said to be equally orthodox on this point. The church of Rome, the Greek church, the various Protestant churches—established and dissenting—all agree, taking their standards as a criterion, in resting the sinner's hope of salvation on the mediatorial work or A. of Jesus Christ. Nevertheless, there have been from the very beginning of speculative Christian theology, and still continue to be, within the bosom of the several churches, various ways of conceiving and explaining the exact nature and mode of operation of this mediatorial work. What follows is a brief sketch of the historical development of these speculations.

Christianity differs from heathenism in the clear perception which it has of the antagonism sin has introduced between God and man. Heathenism but vaguely conceives of this variance, and consequently has but an ill-defined notion of the atonement required, the notion seldom containing more than the idea of a reconciled union of the individual man with nature and the universal life. Even where its mythical divinities assume personality, it is but an ideal personality without any concrete reality of life, and consequently without any real significance for the conscience. In this state, the abject subjection of man to nature prevents his rising into that sphere of conscious freedom which makes sin sinful, and demands an A. with one who is Lord both of nature and man.

In Judaism, man stands above nature, in conscious relation to a personal God, whose written law exhibits the requirements of his relationship with man—requirements which are never met, and which only make him fearfully conscious of the ever-widening breach between him and his God. Thus the law awakened the sense of guilt, and the desire for an A.; a desire it could never satisfy. The never-ceasing demands of these ever-unfulfilled requirements were constantly acknowledged by its whole sacrificial *cultus*, which expressed the hidden ground of Jewish hope, and prophetically pointed to its future manifestation.

But whilst the holy Scriptures, throughout the Old Testament, exhibit the making of an A. by vicarious sacrifice (Lev. xvi. 21; xvii. 11), and the idea, both of the suffering and the deliverance of many by the sins and virtues of one, was common to all antiquity, the idea of the suffering and vicarious Messiah, plainly declared in the writings of the prophets (Luke xxiv. 46; Isaiah liii.; Psalms xxii.), and not entirely hidden from the more thoughtful and devout contemporaries of Jesus (Luke ii. 34; John i. 29), was one which was foreign to the Messianic faith of the great body of the people.

In the New Testament, Christ is everywhere exhibited as one sent from God for the salvation of the world (John iii. 16, 17); and as the condition, on the part of man, of his obtaining this salvation, we read of the requirement of repentance, faith, and reformation (Matt. iv. 17; v. 3, 11; vi. 12; Mark xvi. 16; Luke xv. 11), whilst, on the part of God, as conditioning and mediating his forgiveness of sins, we have exhibited the entire life of Christ upon earth conceived of as embracing severally its individual features (Acts v. 31; Rom. iv. 25; vii. 24); but more especially his death as a ransom for our sins (Matt. xx. 28; xxvi. 28), as a vicarious sacrifice (1 Peter i. 19; 2 Cor. v. 21), by which we are redeemed from the bondage of sin (1 Tim. ii. 6; Gal. iii. 13; 2 Peter ii. 1), and obtain forgiveness (Rom. v. 19; 1 Cor. xv. 3; 1 John i. 7), and eternal life and peace with God (John x. 11; Col. i. 20). Christ is therefore the Mediator between God and man (1 Tim. ii. 5), having made peace through the blood of his cross (Col. i. 20); the propitiation for our sins (1 John ii. 2; iv. 10); and our high-priest who offers himself a sacrifice to reconcile us with God (Heb. ii. 17; v. 1; ix. 28). Moreover, we are also taught that God has in Christ reconciled the world with himself (Rom. v. 10; Col. i. 22; 2 Cor. v. 19).

In accordance with this full and explicit teaching of holy Scripture, we find that the sufferings and death of Christ were ever regarded as of primary and essential importance in his work of redemption; but notwithstanding this, we look in vain throughout the early centuries of the Christian church for anything like a systematic development of the doctrine of the A. The germs of the doctrine existed, but without any logical connection or clearness. "On this head there has been a twofold mistake—sometimes the existing beginnings of many later elaborated dogmas have been overlooked; or, on the other hand, it has been attempted to point out with literal distinctness church doctrines as if already developed." The early church fathers dwell with a sort of inspired devotion upon those facts of the gospel which represent Christ as the sacrifice for our sins, as the ransom paid for our redemption, as our deliverer from the power of Satan, as the restorer to mankind of whatever was lost by the fall of Adam; but they seldom attempt to show

how these blessed results connect themselves with the sufferings and death of Christ; neither do they show in what manner the A. has objectively been made, nor how it is brought to the experience of its individual subjects.

The narrow limits of this article will not allow us to specify the many ways in which the sufferings and death of Christ were regarded in relation to their A. for sin. During the first four centuries there appeared no certainty of opinion as to whether they were a ransom-price paid to God or to the devil. The latter supposition is the more prevalent, and is shared in by Origen and St. Augustine. Gregory of Nyssa explains this opinion by saying that the devil consented to receive Jesus as a ransom, because he regarded him as more than an equivalent for all those under his power; but that, notwithstanding his subtlety, he was outwitted, for, owing to the humiliation in which Christ was veiled, he did not fully recognize him as the Son of God, and consequently was himself deceived. But having consented to receive him as a ransom for mankind, he was righteously deprived of his dominion over man, whilst he could not retain Jesus when he discovered him to be the holy one of God, being horrified and tormented by his holiness.

Athanasius first of all successfully controverted this notion, and maintained that the ransom was paid to God. He argued that as God had threatened to punish transgressors with death, he could but execute his threat. But then it was not becoming the character of God to allow his purpose in the creation of man to be frustrated by an imposition practiced upon him by the devil. The only expedient, therefore, which remained for his deliverance from death, was the incarnation and sacrifice of the Logos in his stead, by which the justice and veracity of God would be maintained, man delivered, the law fulfilled, and the power of the devil broken. It has often been stated that Tertullian uses the term satisfaction with respect to Christ's A. for sin, but this is incorrect, for although he employs the term, he never does so in the sense of a vicarious satisfaction, but only in the sense of making amends for our own sins by confession and repentance.

These elemental and mythical conceptions of the doctrine of the A. remained in a most imperfect and altogether undeveloped condition, until the acute and subtle genius of the Piedmontese archbishop of Canterbury reduced them to order, and presented them in logical consistency. We must regard Anselm, therefore, as the author, at least as to its form, of the doctrine of vicarious satisfaction, which, under various modifications, has ever since continued to be held as the orthodox doctrine of the church. The following is, in all essential respects, his statement of the doctrine: The infinite guilt which man had contracted, by the dishonor of his sin against the infinitely great God, could be atoned for by no mere creature; only the God-man Christ Jesus could render to God the infinite satisfaction required. God only can satisfy himself. The human nature of Christ enables him to incur, the infinity of his divine nature to pay, this debt. But it was incumbent upon Christ as a man to order his life according to the law of God; the obedience of his life, therefore, was not able to render satisfaction for our guilt. But although he was under obligation to live in obedience to the law, as the Holy One he was under no obligation to die. Seeing, then, that he nevertheless voluntarily surrendered his infinitely precious life to the honor of God, a recompense from God became his due, and his recompense consists in the forgiveness of the sins of his brethren.—In this form of the doctrine we are taught the necessity of an active vicarious satisfaction; but Anselm nowhere teaches the passive satisfaction, he nowhere says that Christ endured the punishment of men. Nor do we find in his writings the development of the subjective side of the doctrine—namely, how the satisfaction rendered to God mediates the A. in the experience of the believer.

Subsequent to the time of Anselm, and prior to the reformation, there are two views of the A. which divide the opinions of this period: the one regarding the peculiar manner in which it was accomplished as absolutely necessary, and deriving its efficiency from its objective nature; the other supposing a subjective connection between the sufferings of Jesus and the price of redemption, because this was best fitted to effect the moral transformation of men. According to Anselm, the satisfaction rendered by Christ was greater than the guilt for which he atoned; and it needed to be greater, for the payment of the debt due to God gave men no claim to the favor of God. Thomas Aquinas and his followers maintained Augustine's opinion of the infinite value of the blood of Christ rendering it more than sufficient; while the Scotists maintained that it was sufficient only because God was pleased to regard it as sufficient. But in the period between Anselm and the reformation, little or no progress was made in the development of this doctrine.

We now come to the period of the reformation, when the objective speculations of the schoolmen are brought under the subjective requirements of human souls, and the doctrine of the A. is viewed in this light. In the writings of Luther, one will only with difficulty arrive at his intellectual apprehension of this doctrine in its scientific form; but setting out with the consciousness of sin, one will everywhere discover how he realized that in Christ all sin is "vanquished, killed, and buried, and righteousness remaineth a conqueror and reigneth forever." The following is an outline of the Lutheran doctrine, as laid down in the *Concordienformel*: It is alone by faith we can receive the blessings presented to us in the gospel by the Holy Ghost. Faith justifies, because it appropriates the merit of Christ. Therefore, the righteousness which is imputed to the believer, simply by the grace of God, is the obedience, the suffering, and the resurrection of

Christ, by which he has satisfied the claims of the law, and atoned for our sins. For as Christ is not merely man, but God and man in one person, he was, as Lord of the law, no more subject to it than he was subject to suffering and death. For this reason, his twofold obedience—that which he rendered, on the one hand, by his suffering and death; and, on the other, by his righteous fulfillment of the law on our behalf—is imputed to us, and God acquits us of our sins, and regards us as just, in view of his complete obedience in what he did and suffered. This obedience embraces the entire existence of Christ upon earth, and is so complete that it fully covers the disobedience of men, so that it is not reckoned against them for condemnation. Christ is our righteousness, therefore, only in so far as in his entire person the most perfect obedience is exhibited, which he was able to render in that he was neither God alone nor man alone, but both in one, God and man.

According to Calvin: if one asks how Christ has reconciled us with God, and purchased a righteousness which made him favorable to us, it may be answered generally, that he accomplished this by the whole course of his obedience. But although the life of Christ is to be regarded as paying the price necessary for our deliverance, the Scriptures ascribe our redemption especially to his death. Calvin attached great importance to the particular mode of his death—any other mode of death would not have rendered the same satisfaction to God. He, however, says little or nothing about Christ's fulfilling the law for us, but dwells upon his delivering us from its curse. He does not, therefore, exhibit his active obedience separated, as an essential part of his satisfaction for sin, from his passive obedience. The importance attached to the obedience of his life arises from its natural and necessary connection with his suffering and death. And the great importance attached to his death is drawn rather from the view of its subjective necessity, than from the idea of the divine righteousness—namely, that without such a death there would have been no sufficient ground for the subjective realization of deliverance from sin and guilt. Calvin's view differs from that of the Lutheran *Concordien-formel* in that he does not regard the relationship of God to man merely from the stand-point of punitive and satisfying righteousness, which always leads to the merely negative notion of a Redeemer from guilt and punishment, but looks upon Christ as the highest Mediator, through whom the nature of God is communicated to man. There was a necessity for Christ's incarnation, not merely because, apart from the suffering of the God-man, the divine righteousness could not be atoned, but also because, without such a divine Mediator, there could be no vital relation between God and man. "Had man remained free from all taint, he was of too humble a condition to penetrate to God without a Mediator."

While the reformers established the doctrine of the A. on the theory of Anselm, and extended it so as to make the sufferings of Christ include the divine curse, and introduced distinctions between Christ's active and passive obedience, Socinus endeavored to prove the falseness of Anselm's theory. He shares with the Protestants the subjective principle, which the period of the reformation established, but developed it in a one-sided manner. Socinianism represents man as attaining to oneness with himself and with God by his own moral energy. It rejects that idea of the righteousness of God which makes it impossible for him to forgive sin without satisfaction, as imposing finite limitations upon the divine Being; and also objects to the doctrine of satisfaction, on the ground that satisfaction for sin and forgiveness of sin are incompatible with each other; and, moreover, objects that sin and punishment are of so personal a nature as not to allow of their being transferred. It further opposes the doctrine of the active and passive obedience of Christ, on the ground that the one excluded the other. Another objection maintained the actual impossibility of Christ's rendering the supposed satisfaction for sin.

The doctrine it sought to establish in the place of the one it attempted to overthrow may in brief be stated as follows. Man is reconciled to God by repentance and reformation. Only from an act of man changing his disposition, and not from an act of God changing his relation to man, follows his reconciliation with God. God is in himself ever the same towards man—reconciled from all eternity; man alone has to assume a new relation; as soon as he does this, he is immediately reconciled; by this act of his will, he is at one with God. Only in man's moral state is there any obstacle to his reconciliation. This greatest and holiest accomplishment, the reconciliation of man with God, is achieved by an act of his will.

In this purely subjective theory, repentance occupies the place of faith in the orthodox doctrine, and faith becomes identical with obedience; for repentance and reformation are regarded as but the two sides of the same act of the will. It follows from this that justification is of works as well as reconciliation. A necessity for the sufferings of Christ is shown for the following objects—that he might become our example; better fitted to render us help; that we might have a pledge and guarantee of the divine forgiveness; and as conditioning his resurrection and ascension to glory.

We must now hasten to the form of this doctrine among "modern Calvinists," without attempting further to exhibit the links in the chain of its historic connection. "Modern Calvinism" represents the A. as that satisfaction for sin which was rendered to God, in his public character as moral governor of the world, by the perfect obedience unto death of our Lord Jesus Christ. The nature of this satisfaction was a moral, not a

pecuniary satisfaction. It preserves to the moral government of God its authority, whilst its tendency is to secure the forgiveness of sin. The value of the sufferings of Christ consists in their tendency to uphold the divine moral government unimpaired whilst pardon is extended to those who have violated it, rather than in their intrinsic excellence, which, though essential to, did not constitute their value. There was a moral necessity for Christ's sufferings and death—obstacles to the bestowment of pardon had to be removed—the influence of the Holy Spirit had to be secured. The whole contents of Christ's earthly existence, embracing both his active and passive obedience—a distinction which is unsupported by the word of God—must be regarded as contributing to the A. which he made. Of the actual sufferings of Christ immediately attending his death, it would be unpardonable to speak with confidence, so little has been revealed. It may, however, be considered whether the Savior's deprivation of his Father's countenance may not have been indirectly caused rather by his awful and afflicting sense of the evil of sin, than otherwise?—As to the "extent" of the A., there is a broad distinction to be made between the *sufficiency* of the A., and its *efficiency*. It may be true that Jehovah did not intend to exercise that influence of the Holy Spirit upon all which is necessary to secure the salvation of any one, but as the A. was to become the basis of moral government, it was necessary that it should be one of infinite worth, and so in itself adequate to the salvation of all. The body called Universalists (q.v.) hold both the efficiency and ultimate sufficiency of this great event in history.

The foregoing represents the modified view of the doctrine as advocated by Dr. Payne, and as held, in all essential respects, by such men as Pye Smith and Wardlaw, which in its earlier form, and as found in the writings of Owen and Edwards, maintains that the A. was made only for the elect; and that its necessity with respect to them arose out of the eternal justice of God, which required that every individual should receive his due desert; and, consequently, that the sufferings of Christ were the endurance of punishment equivalent in amount of suffering, if not identical in nature—as Owen maintains—with that to which the elect were exposed; and, moreover, that the meritorious obedience of Christ in fulfilling the law, imputes a righteousness to those for whom the A. secures salvation, which gives them a claim to the reward of righteousness.

Our space will not allow us to present to the reader the various forms which this doctrine is made to assume in the philosophic theology of Germany from Kant to the present time. See NEANDER. We must, therefore, confine ourselves to the presentation of those views of the doctrine advocated by our own countrymen in our own time, which may fairly represent the present state of opinion with respect to this fundamental doctrine.

Let us begin with the view of modern Unitarianism, which may very clearly and fairly be presented in the words of one of the most able of its advocates, the Rev. Prof. John James Tayler: "There is *one* mediator between God and men, the man Christ Jesus.' This can only refer to unrivaled pre-eminence, not to exclusive function. For all higher minds do, in fact, mediate between their less gifted fellow-creatures and the great realities of the invisible world. This '*one*' is a *human* mediator, 'the man Christ Jesus'—not a being from another sphere, an angel or a God—but a brother from the bosom of our own human family. 'He gave himself a ransom for *all*' who embrace his offers and will hearken to his voice. He brings from God a general summons to repent; and with that he conveys, through faith, a spiritual power to shake off the bondage of sin, and put on the freedom of a new heart and a new life. He is a deliverer from the power of sin and the fear of death. This is the *end* of his mediation. This is the redemption of which he paid the price. His death, cheerfully met in the inevitable sequence of faithful duty, was only one among many links in the chain of instrumentalities by which that deliverance was effected. It was a proof, such as could be given in no other way, of trust in God and immortality, of fidelity to duty, and of love for mankind. In those who earnestly contemplated it, and saw all that it implied, it awoke a tender response of gratitude and confidence, which softened the obdurate heart, and opened it to serious impressions and the quickening influences of a religious spirit."

Prof. Jowett advocates an opinion peculiarly his own, if, indeed, language so confessedly vague and indefinite can be said to embody an *opinion*. It is this: "that the only sacrifice, A., or satisfaction with which the Christian has to do, is a moral and spiritual one; not the pouring out of blood upon the earth, but the living sacrifice 'to do thy will, O God,' in which the believer has part as well as his Lord; about the meaning of which there can be no more question in our day than there was in the first ages."—"Heathen and Jewish sacrifices rather show us what the sacrifice of Christ was not, than what it was. They are the dim, vague, rude, almost barbarous expression of that want in human nature which has received satisfaction in him only. Men are afraid of something; they wish to give away something; they feel themselves bound by something; the fear is done away, the gift offered, the obligation fulfilled in Christ. Such fears and desires can no more occupy their souls; they are free to lead a better life; they are at the end of the old world, and at the beginning of a new one."—The work of Christ is set forth in Scripture under many different figures, lest we should rest in one only. His death, for instance, is described as a ransom. It is not that God needs some payment before he will set the captives free. Ransom is deliverance to the captive. "Whosoever committeth sin is the servant of sin." Christ delivers from sin. "If the

son shall make you free, ye shall be free indeed." To whom? for what was the ransom paid? are questions about which Scripture is silent, to which reason refuses to answer.

A remarkably original work was issued several years ago by the Rev. John M'Leod Campbell, on the subject of the A. His views are as follows: The work of the Son of God, who came to do and did the will of His Father, must, in view of the deliverance which he wrought, be regarded as twofold: first, as dealing with man on behalf of God, and second, as dealing with God on behalf of man.

In dealing with man on behalf of God, Christ revealed to us the Father in his relation to a sinful world, showed us what our sins were to God, vindicated in the world the Father's name, and witnessed to the excellency of that will against which we were rebelling. In thus revealing the will of the Father towards sinful men, he necessarily became a man of sorrow and suffering, but these arose naturally out of what he was, and the relation in which he stood to those for whom he suffered; and to the holiness and love of his very nature must we refer their awful intensity and immeasurable amount. He suffered what he suffered just through seeing sin and sinners with God's eyes, and feeling in reference to them with God's heart. By what he suffered, he condemned sin, and revealed the wrath of God against it. His holiness and love taking the form of suffering, compose the very essence and adequacy of his sacrifice for sin.

Again, in dealing with God on behalf of man, the oneness of mind with the Father which towards man took the form of condemnation of sin, became in his dealing with the Father in relation to us a perfect confession of our sins, which was a perfect amen in humanity to the judgment of God on the sin of man. Such an amen was due in the truth of all things, due on our behalf, though we could not render it, due from him as in our nature and our true brother. He who was the truth, could not be in humanity and not utter it; and it was necessarily a first step in dealing with the Father on our behalf. This confession of our sins by him who, as the son of God and the son of man in one person, could perfectly realize the evil of man's alienation, was a peculiar development of the holy sorrow in which he bore the burden of our sins; and which, like his sufferings in confessing his Father before men, had a severity and intensity of its own. But apart from the sufferings present in that confession, this amen from the depths of the humanity of Christ to the divine condemnation of sin, is necessarily conditioned by the reception of the full apprehension and realization of the wrath of God, as well as of the sin against which it comes forth into his soul and spirit, into the bosom of the divine humanity, and, so receiving it, he responds to it with a perfect response, and in that perfect response he absorbs it. For that response has all the elements of a perfect repentance in humanity, for all the sin of man—a perfect sorrow—a perfect contrition—all the elements of such a repentance, and that in absolute perfection; all—excepting the personal consciousness of sin—and by that perfect response or amen to the mind of God, in relation to sin, is the wrath of God rightly met, and that is awarded to divine justice which is its due, and could alone satisfy it.

This confession of the world's sin by the head and representative of humanity, was followed up by his intercession as a part of the full response of the mind of the Son to the mind of the Father—a part of that utterance in humanity which propitiated the divine mercy by the righteous way in which it laid hold of the hope for man which was in God. "He bore the sins of many, and made intercession for the transgressors."

The Rev. F. D. Maurice professed to hold a purely biblical theology, as opposed to the theologies of consciousness, which he repudiates. His doctrine of the A. is the answer which the Bible gives to the demands of a sin-smitten conscience. A sinner requires, and is content to be told on the authority of Scripture, that the Son of God has taken away sin. This message from God is the gospel for all men. The sinner wants to be assured that God has spoken, that he has declared himself the reconciler, and desires to be shown how and in whom he has accomplished that work on his behalf.

To this question—How and in whom the work of reconciliation has been accomplished?—Mr. Maurice replied, in effect and almost in words as follows: The will of God is set forth in the Bible to be a will which is good to all, and the ground of all that is right, true, just, and gracious; that it also sets forth the Son of God as being one in will, purpose, and substance with the Father, and that his whole life on earth was an exhibition of and submission to his Father's will; that the Son of God was Lord of men, the root and head of humanity, and the source of all light and righteousness in man: that being thus one with God and one with man, he brought the will of God into our nature, fulfilled it in our nature perfectly, and carried it down into the lowest condition into which it had fallen through sin; that in the fulfillment of this will in our nature, as its head, he shared its sufferings, enduring that wrath, or punishment, which proceeded from holy love, thus realizing, on the one hand, the sins of the world, and on the other, the consuming fury of the holiness of the love of God—with an anguish which only a perfectly pure and holy being, who is also a perfectly sympathizing and gracious being, can feel: that the man Christ Jesus was for this reason the object of his Father's continual complacency—a complacency fully drawn out by the death of the cross—which so perfectly brought out to view the uttermost power of self-sacrifice which lay hidden in the divine love, and consequently that he exhibited humanity, in its head, atoned for, reconciled. In this way, to Mr. Maurice, is Christ "the Lamb of God, which taketh away the sin of the world."

Finally, Dr. Trench, who may be regarded as fairly representing the prevalent views of the more devout and thoughtful men of the present day holding orthodox opinions, speaks as follows: "The spirit of man cries out for something deeper than repentance, confession of sin, amendment of life; something which shall reach further back; which shall not be clogged with sinful infirmities, as his own repentance even at the very best must be. Men cry for some work to rest upon, which shall not be *their* work, but which shall be God's; perfect, complete. They feel that there must be something which God has wrought, not so much *in* them as *for* them; they yearn for this, for A., propitiation, ransom, and conscience purged from dead works by the blood of sprinkling; a rock to flee to which is higher than they, than their repentance, than their faith, than their obedience, even than their new life in the spirit. Now, this rock is Christ; and John the Baptist pointed to this rock, when, to those about him who longed after more than amendment of life, he exclaimed, in the memorable words: 'Behold the Lamb of God which taketh away the sin of the world.'"

Christ's sacrifice was vicarious—he died not merely for the good of, but in the room and in the stead of others, tasted death *for* them. He did this of his own free will. He saw that nothing else would overcome their sinful perversity and willful obduracy, and that this would be effectual to do so.

Christ took upon himself the penalties of a sinful world, and his self-sacrifice is only *not* righteous, because it is so much better than righteous, because it moves in that higher region where law is no more known, but only known no more because it is transfigured into love. Vicarious suffering is the law and condition of all highest nobleness in the world. It is this which God is continually demanding of his elect, they approving themselves his elect as they freely own themselves the debtors of love to the last penny of the requirements which it makes.

But the sufferings and death of Christ were not merely vicarious, they were also satisfactory; and thus atoning or setting *at one*, bringing together the holy and the unholy, who could not have been reconciled in any other way. It is not maintained that God could have pleasure in the sufferings of the innocent and the holy, and that innocent and holy his own Son; but only that he must have the highest pleasure in the love, the patience, the obedience which those sufferings gave him the opportunity of displaying, which but for those he never could have displayed. Christ's sublime devotion to the will of God permitted the Father to say, "I have found a ransom." Christ satisfied herein, not the divine anger, but the divine craving and yearning after a perfect holiness, righteousness, and obedience in man; which craving no man had satisfied, but all had disappointed before.

The reader is referred for further and fuller information on this subject to the following works, which have been consulted and used in the preparation of this article: Baur's *Christliche Lehre von der Versöhnung*; Hase's *Hutterus Redivivus*; Neander's *Christliche Dogmengeschichte*; Gieseler's *Lehrbuch der Dogmengeschichte*; Hagenbach's *Lehrbuch der Dogmengeschichte*, vierte Auflage; Calvin's *Institutes of the Christian Religion*; Edwards, *Concerning the Necessity and Reasonableness of the Christian Doctrine of Satisfaction for Sin*; Owen's *Death of Death in the Death of Christ*, and *Of the Death of Christ*; Payne's *Lectures on Divine Sovereignty*; Chalmers's *Institutes of Theology*; Wardlaw's *Systematic Theology*; Campbell's (John McLeod) *Nature of the Atonement*, etc.; Tayler's (J. J.) *Christian Aspects of Faith and Duty* (discourse on "Christ the Mediator"); Maurice's *Theological Essays*; Jowett's *St. Paul's Epistles*, first and second editions (article "On Atonement and Satisfaction"); Trench's *Five Sermons* (sermon on "Christ the Lamb of God").

ATOOTI, ATAUI, or TAUAI, one of the Sandwich islands, 22° 8' n., and 159° 20' w.; about 40 m. long; 240 m. n.n.w. of Hawaii; pop. 4961. It is rugged and broken, with peaks rising 7000 ft., on one of which was a station for observing the transit of Venus in 1874. The ports are Waimea and Hanaloï.

ATRA'TO, a river of Colombia, more important from its position than from its magnitude. It has already been mentioned under the head of AMERICA in connection with the scheme of opening a communication by water between the Atlantic and the Pacific.

The main stream falls into the gulf of Darien by 9 mouths—the quantity of water, from the almost daily rains, being large in proportion to the area drained, which does not, at the utmost, exceed 300 m. by 75. Of the 9 mouths, the third in rank, the Boca Coquito, appears to offer the most available facilities for improving the navigation. About 220 m. above this entrance, opposite to Quibdo, the A. is 850 ft. wide and 8 ft. deep at the shallowest parts, while the entire fall to the sea averages less than 3 in. to a mile. Unfortunately, however, the A. itself cannot advantageously be followed thus far, because, as one advances to the s., the intervening ridge to the w. and its streams towards the Pacific become less and less practicable.

A comparatively convenient route was surveyed through the munificence of Mr. F. M. Kelley, a private citizen of New York. Ascending the Boca Coquito as before, this route leaves the main stream at a distance of 63 m. from the sea, following the Truando, one of its western affluents, for 36 m. more without impediment or interruption. From this point on the Truando to the Pacific there would still remain 32 miles.

The heaviest work would be a tunnel of  $3\frac{1}{2}$  m. in length. According to the plan, the canal would be without a lock. The examination made by the United States government in 1871, resulted in the opinion that the route which promised the least difficulty lay between the middle branch of the A. and the Jurador, flowing into the Pacific, which would require 48 m. of canal. Thus would the A. realize the destiny which Humboldt chalked out for it 70 years ago.

**ATREBATES**, or **ATREBATES**, a people of Belgian Gaul, whose name survives in Artois. In a confederation against Julius Cæsar they furnished 15,000 troops. There was once a colony of them in Britain, in Berks and Wilts.

**ATREUS**, in Greek legend, son of Pelops and Hippodamia, grandson of Thyestes and Nicippe, whose fortunes and misfortunes, with those of his family, were the favorite themes of Grecian writers and artists. A. married Cleola, by whom he was the father of Pleisthenes; his next wife was Aërope, widow of his son Pleisthenes, and by her he had Agamemnon and Menelaus; his last wife was Pelopia, daughter of his brother Thyestes. The main story of A. begins in blood, he and Thyestes being induced by their mother to kill their step-brother Chrysippus, the son of Pelops and the nymph Axioche. After the murder, the perpetrators fled to Mycenæ, where the king, Sthenelus, was their brother-in-law. The son and successor of Sthenelus lost his life in war with the Heracleids, and Atreus succeeded him as king of Mycenæ. Calamity and crime followed rapidly. Thyestes seduced A.'s wife Aërope, and stole the golden fleeced ram, which was the gift of Hermes. A. expelled Thyestes, who sent A.'s own son to kill him, but the father slew the son without recognizing him. Then A. prepared a great revenge. Professing to be reconciled to Thyestes, he invited him to Mycenæ, killed Tantalus and Platenes (the two sons of Thyestes), and served them for a banquet to their father. In the midst of the meal, A. had the skeletons of the dish brought in to edify Thyestes, who, struck with horror, cursed the house of A. and fled, while the sun turned its face from the scene. The kingdom of A. was next stricken with famine, which the oracle said could be remedied only by recalling Thyestes. A. went in search of him, and, at the court of king Thesprotus, married a third wife, Pelopia, who was the daughter of his brother Thyestes, though A. supposed her to be the daughter of Thesprotus. When married, Pelopia was with child by her own father, and this child she exposed to die, but he was brought up by shepherds, and known as Ægisthus, and when A. heard of him he brought him up as his own son. Æschylus says that A. sent Agamemnon and Menelaus in search of Thyestes, whom they brought back to Mycenæ; that A. imprisoned him and sent Ægisthus to kill him; that Ægisthus, having been recognized by his real father, returned with the story that he had done the deed, and immediately slew A., who was offering sacrifice on the sea-shore.—It is believed that the tomb and the treasury of Atreus in Mycenæ have been discovered by Dr. Schliemann, the explorer of the ruined city.

**ATRI** (anc. *Hadria Picena*), a t. of south Italy, in the province of Teramo, and 14 m. s.e. from Teramo, on a steep hill, 6 m. from the Adriatic. It is of very great antiquity, and some of its coins bear a legend in Etruscan characters. Numerous remains of public buildings, baths, and walls attest its ancient importance. In a hill near the town are some remarkable subterranean chambers, supposed to be excavations of a very remote age. They are formed with the greatest regularity, but their purpose is unknown. A. is a bishop's see. It has an aspect of stagnation and decay. Pop. 3632.

**ATRIP**. An anchor is said to be A. when it is just drawn out of the ground in a perpendicular direction. A top-sail is A. when it is just started from the cap.

**ATRIplex**. See **CHENOPODIACEÆ** and **ORACHE**.

**ATRIUM**, in Roman architecture, was the covered court or entrance-hall which formed the chief part of a Roman house. It was lighted from the roof, which sloped towards an opening in the center (the *compluvium*), through which the rain-water flowed into a kind of cistern situated on the floor (the *impluvium*). On both sides, passages led to the several chambers. Its size was in proportion to the other parts of the house. After the burning of Rome in the reign of Nero, great attention was paid to the decorations of the entrance-halls or *atria*. Here the female slaves were engaged in weaving and other domestic occupations, under the superintendence of their mistress. Family pictures were preserved in the A., it also contained the nuptial couch, and it served as a general waiting-room for visitors and clients. The *atria* of the temples were used as places of assembly of the senators, and for other public meetings.

**ATROPA**. See **BELLADONNA**.

**ATROPHY** (Gr. *atrophia*, want of nourishment; from *a*, not, and *trophé*, nourishment) is a morbid condition of animal or vegetable life, resulting in deficient nutrition of the body, or part of the body, and a consequent decay and waste of its substance. The term is not applied to the mere withholding the requisite supply of nutriment, but to the condition produced by various diseases that affect the body. See **NUTRITION**, also **DIGESTION**, **DYSPEPSIA**, **HYPERTROPHY**.

**ATROPIA**, or **ATROPINE** ( $C_{17}H_{23}NO_3$ ), is an alkaloid existing in all parts of the deadly night-shade (*atropa belladonna*), and in the seeds of the thorn-apple (*datura*

*sramonium*); hence it has also been called DATURIA or DATURINE. The pharmacopœial directions for extracting it from the roots of belladonna by means of alcohol are somewhat complicated. It is first taken up in combination with malic acid, which is removed by the addition of lime; sulphuric acid is then added, which throws down the lime and forms sulphate of atropia: the atropia is liberated by carbonate of potash, which also separates and resolves impurity, and is taken up by chloroform, which, after being distilled off, leaves atropia, which must be finally purified by decolorization with charcoal, and crystallization from an alcoholic solution. The crystals occur in colorless silky needles, united in tufts. It is so highly poisonous that no one has ventured to use it internally in medicine. A single drop of a solution containing 1 grain of atropia, 1 minim of nitric acid, 3 minims of spirit, and a drachm of distilled water, let fall on the lower eyelid, will dilate the pupil to fully double its ordinary size in the course of about ten minutes, the dilatation lasting for four or five days. The solution thus used is now generally preferred to the dirty practice of smearing the vicinity of the eye with belladonna ointment, in all those cases in which the oculist requires the pupil dilated.

ATROPOS, one of the *Moirai*, or Fates—she who severs the thread of man's life. She is represented with a cutting instrument, or a pair of scales, or a sun-dial.

ATROWLI, a t. of British India, the chief place of a pergunnah of the same name, in the district of Allypore, North-west Provinces, 63 m. n.e. from Agra. The streets are wide, the bazaar good, and the supply of water abundant. Pop. '71, 15,052.

A TRYPA, a genus of fossil brachiopod or lamp-shells, having a close resemblance to the well-known *terebratula*. It possessed a perforation for the passage of the peduncle, by which the animal attached itself to foreign bodies. This foramen is not visible in all examples of the same species, from the beak touching and overlying the umbo of the other valve; the animal was, therefore, probably free during a portion of its existence. The name (derived from *a*, without, and *trypa*, foramen) was given to this genus by Dalman, as he erroneously supposed that the perforation was entirely absent. Judging from the markings on the interior of the shell, the animal seems to have differed little from the recent *rhynchonella*, except that it had large calcareous spines for the support of its labial appendages. A. is a strictly palæozoic brachiopod, the solitary permian species being the last representative of the genus. Of the 179 described species, 100 are silurian, 56 devonian, 22 carboniferous, and 1 permian.

ATTACHÉ (French), a subordinate or assistant. The term is generally applied to young diplomatists who accompany embassies.

ATTACHMENT is an English legal term, signifying the form of process by the authority of which the person or the goods of a debtor may be seized in satisfaction. As a proceeding against the person, it is a species of criminal process, and has the force of much that will be found under Apprehend (q.v.): but in strictness, it means a process issuing from a court of record against a person guilty of a contempt, or, more properly, of a judicial contempt, and who is punishable in a summary manner by the court in whose presence, against whose authority, or against whose writs the contempt has been overtly displayed. Thus, in Hawkins's *Pleas of the Crown*, such contempts are thus classed: 1. Disobedience to the queen's writs; 2. Contempts in the face of a court; 3. Contemptuous words or writings concerning a court; 4. Refusing to comply with the rules and awards of a court; and 5. Forgery of writs, or any other deceit tending to impose on a court. Parties are also liable to the process of A. as for a contempt of court where, in an arbitration (see ARBITRATION) the award having been made a rule of court under the 9 and 10 Will. III. c. 15, the parties refuse to obey the same. In Chancery, there may be A. of the person for judicial default or other offense to the court, as, for example, where a defendant fails to put in his answer or proper plea to the plaintiff's bill of complaint. The only other process of A. against the person which it is necessary here to notice, is the non-attendance in court of a witness, who in such event is considered to have committed a contempt of court, and to be liable to be punished for such contempt by attachment. An action may also be brought against such defaulting witness at the suit of the aggrieved party, on account of any loss or damage occasioned by the non-attendance.

The proceeding by A. of goods resembles in some respects the Scotch diligence or process of arrestment. See ARRESTMENT. The best illustration we can give of it, in this sense, is that relating to the power of a judgment creditor to recover under his judgment. By the 17 and 18 Vict. c. 125, it is provided that the judgment creditor may apply to the court or a judge for a rule or order to have the debtor orally examined as to the debts owing to him by any third party or *garnishee*, as he is called (see GARNISHEE), and also for an order that all such garnishee debts be attached to answer the judgment debt, the service of which order has the effect of binding or attaching the debts in the garnishee's hands.

ATTACHMENT (*ante*), in American usage applied generally to a writ for taking possession of person or property. In regard to persons, A. is issued for contempt of court or of its proceedings, and is in the nature of a criminal process. Concerning property, A. issues to seize effects, credits, or rights, to secure the demands of a plaintiff. In New England a summons has the force of A.; but in most of the states the writ

is issued only upon cause shown, and must be antedated by a bond from the defendant to make good any damages that may come from the act. In general, remedy by A. is allowed to a creditor only. Corporations and legal representatives may be reached by A. An A. does not affect the status of the property seized, and neither impairs nor enhances the owners' rights; it is only a lien on the property, and valueless if the claim be unfounded. Usually the officer making an A. is held responsible for the things seized until final adjudication. In some states the owner may keep possession of the property by giving a bond with sureties to deliver as the court may direct; in some, the A. may be dissolved on giving a bond to secure the plaintiff and what he may recover. Judgment for the defendant dissolves an A.; in some states it is dissolved by the death of the defendant, or of a corporation. Suits may be brought for malicious A., and the proceedings will be governed by the law applicable to malicious prosecution.

**ATTACHMENT, FOREIGN.** See FOREIGN ATTACHMENT.

**ATTACK**, in military warfare, is an advance upon the enemy, with a view of driving him from his position. It may either be an attack in the open field or an attack upon a fortress.

In an attack in the open field, the general first ascertains the strength and position of the enemy, by means of a reconnaissance or of spies. He then seeks to discover at what point the enemy can make the least resistance; which is generally on one or other flank. He next arranges to concentrate his chief strength upon this particular point, and to mask his real intention by feigned operations in other places. He then attacks with energy and force, his troops advancing without halt till near enough to use their weapons with the greatest effect. The more the attack has the character of a "surprise," the greater the probability of its success. In order to make this success as much felt as possible, and to be provided also against unforeseen disaster, the attacking body should be followed at a distance by a reserve; a neglect of this precaution has frequently caused the entire failure of an attack. Various forms have been devised for the attack; but generally the *parallel* or *frontal* is the one made use of. Frederick the great, however, won most of his battles by the oblique attack, in which one wing is more advanced than the other. The first Napoleon preferred, by means of his heavy columns, to penetrate and break up the enemy's center. Another mode combines an attack on one flank as well as in front, by two separate corps, so as either to get into the enemy's rear, or to perplex him as to his retreat. A skillful general will be guided by circumstances in his selection among these several modes of operating. An attack by night might act most signally as a surprise; but as this requires a very exact knowledge of the ground, an attack at early dawn is generally preferred.

The different arms of the service render each its own kind of aid during an attack. First come the skirmishers, or perhaps whole battalions of light and active troops, whose rifles or long-range guns commence the firing. Then come the main body of infantry in heavy column; they halt within musket-shot, fire, and charge with the bayonet—the skirmishers meanwhile deploying round to the rear of the column, but holding themselves in readiness to harass the enemy's flanks. English troops especially excel in the attack by bayonet in line; but foreign armies, for the most part, rely more upon the momentum of a compact and heavy column in an attack. There are positions in which the cavalry attack, with its shock and the use of the sword, is more efficacious than that of the infantry. The troopers approach at a trot, break into a gallop at a distance of one or two hundred paces from the enemy, and endeavor by their weight and impetuosity to force the enemy's line. There are many forms of cavalry attack, according to the nature of the ground and the position of the enemy. The artillery, working at a distance, often begin an attack long before the infantry and cavalry can come up, harassing and confusing the enemy. At 800 to 1200 yards' distance, the artillery pour out shot and shell, and try to silence the enemy's guns, so as to make way for the attack of the infantry; while the bayonet-charge is being made, the artillery keep in check the enemy's cavalry. If the attack succeeds, the infantry and artillery take up the ground recently occupied by the enemy, leaving the cavalry and riflemen to maintain a pursuit; but if it fail, the artillery and cavalry take up such positions as will cover the retreat of the infantry.

In an attack upon a fortress, the operation is a part of that of besieging (see SIEGE); but very often intrenchments are attacked in the open field. Such an attack has the character of a surprise, when the works are approached under cover of night, and an attempt is made to break into them on all sides. In such case, there is a reserve corps, which is rapidly brought up when wanted; but the attacking corps retire behind the reserve, if repulsed. The artillery post themselves on the prolongation of the line of works, and try to dislodge the enemy's guns and gunners; or pour a concentric fire sufficient to breach the works. The infantry advance as close as will enable them to fire upon the gunners. When the enemy's fire is silenced, the engineers (under cover of the artillery) proceed to remove palisades and all other obstacles, and to bridge over ditches and openings. Then follow the operations of the storming-party, analogous to those noticed under ASSAULT.

**ATTAINDER** is the legal consequence of judgment of death or outlawry, in respect of treason or felony. It is said to have been derived from the Latin word *attinctus*,  
U. K. I.—55.

attaint, stained, and it is followed by *forfeiture of estate*, real and personal, and by *corruption of blood*; and generally it imported extinction of civil rights and capacities. Thus, an attainted person cannot sue in a court of justice; he loses all power over his property; and he is by his A. rendered incapable of performing any of the duties or enjoying any of the privileges of a free citizen. But absolute and severe as the consequences of A. seem to be, they had their limits. In regard to the attainted person, neither the government nor the crown could exercise absolute or capricious authority; everything must be done according to legal and constitutional principle and rule, and for the ends of public justice alone. Formerly, an attainted person could not give evidence in a court of justice; but that disability in England has been removed by the 6 and 7 Vict. c. 85, and in Scotland by the 15 and 16 Vict. c. 27.

We have stated that the immediate consequences of A. were *forfeiture of estate and corruption of blood*. The forfeiture was of estate real and personal. But in 1870 the law on this subject was revised and made more consistent with reason by the act 33 and 34 Vict. cap. 23. No conviction for treason or felony now causes any A. or corruption of blood, or forfeiture or escheat. When a convicted person is sentenced to any punishment more severe than 12 months' hard labor, he is deprived of any public office or employment, and of any public pension, or of the right of voting at elections. He may be condemned to pay the costs or expenses incurred in procuring his conviction, and in cases of felony to make payment of a sum not exceeding £100, as compensation for any loss of property caused by such felony. He cannot sue for any property, debt, or damage. While he is a convict undergoing any imprisonment, her majesty may appoint paid administrators to take charge of his property at the convict's expense, to deal with the property, and pay debts, and do what is needful. They may also pay out of his property satisfaction for any loss or injury suffered by third parties in consequence of his criminal or fraudulent acts, though no proof of such criminal or fraudulent acts may have been made in any court of law. They may also make allowances to support the convict's family. If the crown does not appoint an administrator, justices of the peace may appoint interim curators, if satisfied that it will benefit the convict or his family, or the due administration of his property and affairs. Should any person intermeddle with the convict's property, the attorney-general or next of kin might call them to account. When the convict ceases to be such, by the expiration of his sentence, then the administrators or curators are to account to him for all his property, or rather the surplus, like any other guardians appointed by law. If during the sentence any property be acquired by the convict, it is not to vest in the administrators, but is to be his own, as in other ordinary cases.

The old consequence of A.—viz., *corruption of blood*, is anxiously and learnedly treated of in old law-books, and in Blackstone's *Commentaries*; but the ancient law on the subject had been so much narrowed in its application by modern legislation as to have lost much of its importance; and, indeed, this doctrine of corruption of blood was in modern times always looked upon as a peculiar hardship, at least as regards the family of the offender; and now, by the statutes 54 Geo. III. c. 145, already referred to, 3 and 4 Will. IV. c. 106, and 13 and 14 Vict. c. 60, whatever savored of inhumanity or harshness under the ancient system has been effectually removed; in fact, it is now enacted that, even with the cases of treason and murder, the law of corruption of blood, so far as the family of the offender are concerned, has ceased to form part of the law. Besides A. by the operation of law as above stated, there have been frequent instances of attainders by express legislative enactment, as to which see BILL OF ATTAINDER.

The Scotch law of A., consequent on a conviction for treason, corresponds to the English doctrine; and although the word A. is not a Scotch technical term in regard to crimes other than treason, the forfeitures consequent on conviction and judgment are very much the same as the English.

ATTAINDER (*ante*) is unknown in the United States, the 9th section of the 1st article of the federal constitution declaring: "No bill of attainder or ex-post facto law shall be passed."

ATTAINDER, BILL OF. See BILL OF ATTAINDER.

ATTAINT, WRIT OF, was anciently a mode of inquiring whether a jury had given a false verdict, which has been abolished by the 4 Geo. IV. c. 50. A. is, however, still in use to some extent as a technical word in the law of England; thus, there is the plea of *autrefois A.*, or of a former attainder, for the same crime, and now regulated by the 7 and 8 Geo. IV. c. 28, s. 4.

In the old Scotch criminal law, A., or *attaynt*, signified a conviction, or being convicted.

ATTAK'APAS, an unofficial designation for a large and fertile section in the southwestern part of Louisiana, remarkable for the production of sugar and molasses. The ATTAKAPAS INDIANS were a tribe in Louisiana called by the Choctaws "Men Eaters." The tribe became extinct many years ago.

ATTALA, a co. in central Mississippi, on Big Black river; 750 sq. m.; pop. '70, 14,776—5948 colored. It produces cotton, corn, sweet potatoes, and some wheat. The Chicago, St. Louis, and New Orleans railroad touches the w. border. Co. seat, Kosciusko.

**ATTALIA**, a genus of palms, comprising a number of species, natives of the tropical parts of South America. They have in general lofty cylindrical smooth stems, but there are some stemless species. The leaves are large and pinnate. The fruit has a dry fibrous husk, inclosing a nut with three cells and three seeds. The leaves of some species are much used for thatching, and those of some are woven into hats, mats, etc. The nuts of *A. excelsa* and of *A. speciosa* are burned to dry the India-rubber obtained from the *siphonia elastica*, which acquires its black color from their smoke. The leaf-stalks of *A. funifera*, which is found in the southern maritime provinces of Brazil, and is there called piassaba, yield a fibre much used for cordage. The ropes made of it are very strong, and extremely durable in salt water. The piassaba palm of the northern parts of Brazil, however, is totally different, and much of the piassaba (q.v.) fibre imported into Britain is obtained from it. The fruit of *A. funifera*, known by the name of coquilla nut, is as large as an ostrich's egg, and supplies a kind of vegetable ivory, used for making umbrella handles, etc. The fruit of *A. compta*, the pindóva or indaja palm, is of the size of a goose's egg, and the kernels are eatable. It is a stately and beautiful tree, with a wide-spreading crown.

**ATTALUS**, uncle of Cleopatra, the wife of Philip of Macedon. He was a general under Philip, and had much influence over him. At the marriage of his niece he asked the company to beg of the gods a legitimate heir to the throne, an insinuation against Alexander, who was present and who resented it. In the fight which ensued, Philip drew his sword against Alexander, who, with his mother, soon afterwards withdrew from the kingdom. Philip lost his life because of his partiality for A., for when A. had outraged Pausanias, a young man of noble family, and Pausanias had asked redress from the king without getting it, the incensed youth assassinated Philip himself. Thereafter A. played a double part with Alexander and Demosthenes, and was finally assassinated by Alexander's orders.

**ATTALUS I.**, 269-197 B.C., King of Pergamus. He defeated the Gauls who had occupied Galatia, and was an ally of Rome in a war against Philip of Macedon.

**ATTALUS II.**, surnamed PHILADELPHUS, 200-138 B.C.; king of Pergamus. Before coming to the throne he gained distinction as a brave and able military leader, and was on several occasions sent as ambassador to Rome. He succeeded his brother Eumenes, 159 B.C. His reign was full of wars, in which his fortune was generally good. He founded Philadelphia in Lydia, and Attila in Pamphylia, and was a generous patron of the arts.

**ATTALUS III.**, called also PHILOMETOR, son of Eumenes II. and Stratonice; succeeded his uncle A. Philadelphus as king of Pergamus, 138 B.C. He is unfavorably known for conduct so extravagant as to seem the effect of insanity, and for the murder of friends and relatives. Being overcome with remorse, he suddenly abandoned public business, and spent his time in gardening and in sculpture. He was sunstruck while supervising the erection of a monument to his mother, and died of fever, 133 B.C. His will made the Roman people his heir.

**ATTALUS**, FLAVIUS PRISCUS, for one year (409-10) emperor of the west, and the first raised to that office solely through barbarian influence, being declared by Alaric and his Gothic army after the second surrender of Rome, when Honorius was deposed. The barbarians set A. up at Ravenna, whence he sent a message to Honorius commanding him to leave the throne, retire to a desert island, and cut off his feet. But Alaric soon wearied of him, and he was deposed. After Alaric's death, A. remained with Ataulphus, where he celebrated as a musician the nuptials of Placidia. Ataulphus put A. forward again as a rival emperor during the insurrection of Jovinus, but he was taken prisoner and brought to Honorius, who inflicted on him a part of the sentence he had written for the Roman emperor; he cut off his thumb and forefinger, and banished him to the island of Lipari.

**ATTAMAN**, or **HETMAN**, the title of the leading chief of the Cossacks of the Don. Formerly the A. was elected by the people, the mode being for each man to throw his fur cap at his candidate, the one having the largest heap of caps being elected. While the Cossacks were under the Poles, the A. was chosen by the Polish king. Under Russia they reserved their A. rights until the insurrection of Mazeppa, after which the office was suppressed. The last elected A. was Platoff, after whom the title became hereditary in the Russian heir-apparent.

**ATTAR**. See OTTO.

**ATTEMPT** to commit a felony or criminal offense is in many instances equally cognizable by the criminal tribunals with the completed crime itself. See TREASON, FELONY, MISDEMEANOR.

**ATTENTION**, the concentration of consciousness, or direction of mental energy upon a definite object. By means of it we bring within the circle of our conscious life, perceptions and ideas which could not otherwise have risen from their obscurity; or we render clearer and more distinct those already under notice. Its mode of operation, and the effect produced, may be compared with the concentration of visual activity on some definite part of the field of vision, and the clearer perception of the limited portion

thereby attained. In both cases the effect is brought about, not by any change in the perceptions themselves, but by isolating them and considering them to the exclusion of all other objects. Since all consciousness involves discrimination, that is, the isolation of one object from others, it involves A., which must therefore be defined as the necessary condition of consciousness. As the concentration of consciousness upon any one attribute of an object involves the withdrawal of consciousness from all other attributes, the withdrawal is, etymologically and logically, abstraction, which is thus the negative side of attention, the two processes forming the positive and negative poles of the same mental act.

**ATTERBOM, PETER DANIEL AMADEUS, 1790-1855;** a poet of Sweden. He was a leader among the students in the university of Upsal, who formed the association known as the "Aurora," designed to release Swedish literature from slavery to French models and taste. He traveled in Germany and Italy, and became German tutor to prince Oscar; he was afterwards professor at Upsal, and still later a member of the academy which he had so violently assailed. He was the founder and editor of the *Poetical Calendar*, which had much influence on the æsthetic culture of the people. Besides many poems, he was the author of a valuable review of Swedish literature.

**ATTERBURY, FRANCIS,** Bishop of Rochester, was b. on the 6th of Mar., 1662, at Milton, near Newport Pagnel, in Buckinghamshire, and educated at Westminster school, from which, in 1680, he passed to Christ Church, Oxford. In 1687, he gave proof of that ready controversial talent which distinguished him through life, in a reply to a pseudonymous attack on Protestantism by Obadiah Walker, master of University college. Disappointed in his expectation of succeeding to his father's rectory, in 1693, he sought a wider field of distinction, for ambition seems to have stimulated his efforts rather more than the love of souls, and in London his rhetorical powers soon won him reputation. He became a royal chaplain, minister of Bridewell, and lecturer of St. Bride's. In 1698, a temporary sensation was created in the learned world by the appearance of the hon. Charles Boyle's *Examination of Dr. Bentley's Dissertations on the Epistles of Phalaris and the Fables of Æsop*. This clever, but shallow and malicious performance was in reality composed chiefly by A., who had been the young nobleman's tutor at Christ Church. In 1700, he distinguished himself in a controversy with Dr. Wake and others regarding the powers and privileges of convocations. A.'s zealous and caustic defense of the ecclesiastical against the civil authority, procured him the thanks of the lower house of convocation, and the degree of D.D. In 1704, he was promoted to the deanery of Carlisle, on which occasion he subjected himself to just obloquy by attempting to procure an alteration in the date of his predecessor's resignation, which happened to interpose a temporary obstacle to his appointment. In 1707, he was made a canon of Exeter; in 1709, preached at the Rolls chapel; in 1710, he was chosen prolocutor to the lower house of convocation, and in the same year he had the chief hand, according to the common belief, in drawing up the famous defense of Dr. Sacheverell; in 1712, he became dean of Christ Church, where, however, his turbulent and combative spirit had meanwhile involved him in so many controversies, that there was no peace until he was removed; in 1713, he was made bishop of Rochester and dean of Westminster. It is supposed, not unreasonably, that A. aspired to the primacy; but the death of queen Anne extinguished his hopes in that direction. His known character and Jacobite leanings made him no favorite with George I. In 1715, he refused to sign the bishops' declaration of fidelity, and some of the most violent protests of the peers against the government measures proceeded from his reckless pen. His deep complicity in a succession of plots for the restoration of the Stuarts, brought down upon him at length the charge of treason, and, in Aug., 1722, he was committed to the Tower. A bill of pains and penalties was brought into the house of commons, and passed in the lords by a majority of 83 to 43. A., who had defended himself with great ability, was deprived of all his ecclesiastical offices, incapacitated from holding any civil or spiritual office in the king's dominions, and condemned to perpetual banishment. There is no doubt of the fact that A. was implicated in treasonable plots, but the legal proof on which his sentence was founded cannot be regarded as sufficient to justify its severity. In June, 1723, he quitted England for France, and after a short stay at Brussels, finally settled at Paris, where he d., Feb. 15, 1732. In his exile, he maintained a constant correspondence with his friends, and took an active part in the abortive conspiracies of the Jacobites. His fame as a writer is founded on his sermons, and his letters to Pope, Swift, etc.; as a letter-writer, indeed, he has seldom been surpassed.

**ATTESTATION,** in conveyancing, is the verification of the execution of deeds and wills by witnesses; hence the clause at the end of these instruments which immediately precedes the signatures of the witnesses, is called the A. clause. See **DEEDS, WILLS, WITNESSES.** In the Scotch practice, the corresponding clause is called the testing-clause. See **TESTING-CLAUSE.**

**ATTIC,** a term in architecture, employed to designate a low story rising above the cornice that terminates the main elevation of a building; in domestic architecture, it is usually applied to sky-lighted rooms in the roof.

**ATTIC** (pertaining to Attica), characteristic of the people of Athens, or Attica; as "A. dialect" which came to be the best form of Greek, and that in which most of the

great works of antiquity were written. There was an old and a new A. dialect; the former represented in Sophocles, Euripides, etc., and the latter in Demosthenes, and contemporary orators. Sophocles was called "the A. bee," from the sweetness of his compositions; the nightingale was the "A. bird," because Philomel was the daughter of a king of Athens; Xenophon the "A. muse," for eloquence in composition; "A. salt," indicates pungency of wit.

**ATTICA**, one of the political divisions or states of ancient Greece or Hellas, of which Athens was the capital. The territory is of triangular shape, having its n.e. and s.w. sides washed by the sea, while on the n. it is connected with the mainland. In ancient times, it was bounded on the w. by Megaris, and the gulf of Saronica; on the s., which ran out into the "marble steep" of Sunium, by the Ægean sea; on the e., by the Ægean sea; and on the n., by Bœotia, from which it is separated by a lofty range of hills, the most famous part of which was formerly called Cithæron. Ancient A. was thus walled in from the rest of Greece. The two principal rivers were the Cephissus and Ilissus; and if they exhibited the same features in ancient times as they do now, must have been mere mountain-torrents, dry in summer. The unfruitfulness of the soil, and the scarcity of water, compelled the inhabitants occasionally to send out colonies. According to ancient tradition, the aborigines of A. were first civilized under Cecrops, who is said to have come hither from Sais, at the mouth of the Nile in Egypt, about 1550 B.C.; and to have introduced the culture of olives, and of several species of grain, as also to have implanted milder manners, and taught the worship of the gods. He is stated to have divided the country into 12 communities or states. This, however, was not the only division known in early A. A still older division into *phylai*, or tribes, existed, as also a minute subdivision into *demoi*, or townships. By Theseus, Athens was united with the 11 other states of A. under one government, of which Athens was made the seat. After this union of the several states, the whole of A. shared in the fortunes of Athens (q. v.), and, under Vespasian, became a Roman province. On the division of the Roman empire, A. naturally fell into the hands of the Greek emperors. In 396 A.D., it was captured by Alaric, king of the Goths. What may have been its population in ancient times, it is impossible to determine precisely. Clinton estimates it at upwards of half a million, but this is probably exaggerated.

In the present arrangement, Attica and Bœotia form a department or government in the kingdom of Greece. The surface of the country is broken into hills and narrow plains. The most considerable hills are—Oxea, 4636 ft.; Elatê, 4629; Pentelicus, famous for its marble in ancient times, of a white brilliant appearance and perdurable character, 3884; and Hymettus, 3506. The largest plains extend in the neighborhoods of Athens and Eleusis. As early as the time of Solon, A. was well cultivated, and produced wine and corn. Mt. Hymettus was celebrated for its bees and honey, and metals were found in the range of Laurium. Figs, olives, and grapes are still cultivated. Goats and sheep find suitable pasturage; but the country does not now produce much grain. The population of A. and Bœotia (1870) was 136,804.—See Leake on the *Demoi of A.*

**ATTICUS**, TITUS POMPONIUS, one of the most noble and generous men in ancient Rome, was b. in 109 B.C., or a few years before the birth of Cicero. His excellent education, during which he enjoyed the companionship of Torquatus, the younger Marius, and Cicero, developed, at an early age, a love of knowledge, which was increased during his stay in Athens, where he remained many years, glad to be separated from the political distractions of his native land. After 65 B.C., when he was induced by Sulla to return to Rome, he still devoted himself chiefly to study and the pleasures of friendship, and refused to take any part in political affairs. Yet he was by no means without influence on public matters, as he lived on terms of familiar intercourse with several leading statesmen, and freely gave his counsel, which was generally sound and wholesome, while it was always benevolent. He was a man of great wealth, having been left a large inheritance by his father and his uncle, which he greatly increased by judicious mercantile speculations. His mode of life was frugal. When he was informed that a disorder under which he was laboring was mortal, he voluntarily starved himself, and d. in 32 B.C. Among his personal friends, Cicero held the first place. The *Annales*, written by A., were highly commended by his contemporaries. They were especially valuable on account of containing genealogical histories of the old Roman families. A. was one of those men (not uncommon either in ancient or modern times) in whom fine culture and a fortunate social position had highly developed the faculty of good taste. He had no creative genius, but was possessed of such delicate discernment that he could detect the flaw that would have been invisible to Cicero. Every author was anxious to secure his favorable opinion. None of his writings have been preserved. His biography is found in Cornelius Nepos, and in Cicero's *Epistles to A.*

**ATTICUS HERODES**, TIBERIUS CLAUDIUS, b. about 104 A.D., a rich Athenian. To a vast sum of money left him by his father, he added much more by marriage. He was educated by the best masters, devoting special attention to oratory, in which he greatly excelled. He was also a noted teacher of rhetoric, having for pupils Marcus Aurelius and Lucius Verus. From Aurelius he received the archonship of Athens and the consulate of Rome. His fame rests mainly upon immense expenditures for public purposes. In Athens he built a race-course of Pentelic marble, and a splendid theater. In Corinth

he built a theater; in Delphi, a stadium; at Thermopylae, hot-baths; at Canusium, in Italy, an aqueduct. He contemplated a canal across the isthmus of Corinth, but gave it up because Nero had tried and failed. He restored several of the partially ruined cities of Greece, where inscriptions testified the public gratitude to him. For some reasons the Athenians became his enemies, and he left the city for his villa near Marathon, where he d. 180 A.D. Nothing of his writing is known to exist.

**ATTILA** (Ger. *Etzel*; Hungarian, *Ethel*, conjectured to have been originally titles of honor), King of the Huns, was the son of Mundzuk, a Hun of the royal blood, and in 434 A.D. succeeded his uncle Roas as chief of countless hordes scattered over the n. of Asia and Europe. His brother Bleda, or Blödel, who shared with him the supreme authority over all the Huns, was put to death by A. in 444 or 445 A.D. The Huns regarded A. with superstitious reverence, and Christendom with superstitious dread, as the "scourge of God." It was believed that he was armed with a supernatural sword, which belonged to the Scythian god of war, which must win dominion over the whole world. It is not known when the name "scourge of God" was first applied to A. He is said to have received it from a hermit in Gaul. The whole race of Huns was regarded in the same light. In an inscription at Aquileia, written a short time before the siege in 452, they are described as *imminentia peccatorum flagella* (the threatening scourges of sinners). The Vandals, Ostrogoths, Gepidae, and many of the Franks, fought under his banner, and in a short time his dominion extended over the people of Germany and Scythia—i.e., from the frontiers of Gaul to those of China. In 447, after his unsuccessful campaign in Persia and Armenia, he advanced through Illyria, and devastated all the countries between the Black sea and the Mediterranean. Those inhabitants who were not destroyed were compelled to follow in his train. The emperor Theodosius collected an army to oppose the inundation of the barbarians, but in three bloody engagements fortune declared against him. Constantinople owed its safety solely to its fortifications and the ignorance of the enemy in the art of besieging; but Thrace, Macedon, and Greece were overrun; seventy flourishing cities were desolated, and Theodosius was compelled to cede a portion of territory s. of the Danube, and to pay tribute to the conqueror, after treacherously attempting to murder him. In 451, A. turned his course to the w., to invade Gaul, but was here boldly confronted by Aëtius, leader of the Romans, and Theodoric, king of the Visigoths, who compelled him to raise the siege of Orleans. He then retired to Champagne, and in the wide plain of the Marne—called anciently the Catalaunian plain—waited to meet the enemy. The army of the west, under Aëtius and Theodoric, encountered the forces of the Huns near the site now occupied by the city of Chalons-sur-Marne. Both armies strove to obtain the hill of moderate height which rises near Mury, and commands the field of battle, and after a terrible contest, the ranks of the Romans and their allies, the Visigoths, were broken. A. now regarded victory as certain, when the Gothic prince, Thorismund, immediately after his father had fallen, assumed the command, and led on the brave Goths, who were burning to avenge the death of Theodoric. Their charge from the height into the plain was irresistible. On every side the Huns were routed, and A. with difficulty escaped into his encampment. This, if old historians are to be trusted, must have been the most sanguinary battle ever fought in Europe; for it is stated by contemporaries of A., that not less than 252,000 or 300,000 slain were left on the field. A., having retired within his camp of wagons, collected all the wooden shields, saddles, and other baggage into a vast funeral pile, resolving to die in the flames rather than surrender; but by the advice of Aëtius, the Roman general, the Huns were allowed to retreat without much further loss, though they were pursued by the Franks as far as the Rhine. In the following year, A. had recovered his strength, and made another incursion into Italy, devastating Aquileia, Milan, Padua, and other cities, and driving the terrified inhabitants into the Alps, Apennines, and the lagoons of the Adriatic sea, where they founded Venice. The Roman emperor was helpless, and Rome itself was saved from destruction only by the personal mediation of pope Leo I., who visited the dreaded barbarian, and is said to have subdued his ferocity into awe by the apostolic majesty of his mien. This deliverance was regarded as a miracle by the affrighted Romans, and old chroniclers relate that the apostles Peter and Paul visited the camp of A., and changed his purpose. By 453, however, A. appears to have forgotten the visit of the two beatified apostles, for he made preparations for another invasion of Italy, but died of hemorrhage on the night of his marriage with the beautiful Ildiko. His death spread consternation through the host of the Huns. His followers cut themselves with knives, shaved their heads, and prepared to celebrate the funeral rites of their king. It is said that his body was placed in three coffins—the first, of gold; the second, of silver; and the third, of iron; that the caparison of his horses, with his arms and ornaments, were buried with him; and that all the captives who were employed to make his grave were put to death, so that none might betray the resting-place of the king of the Huns.

Jornandes describes A. as having the Mongolian characteristics—low stature, a large head, with small, brilliant deep-seated eyes, and broad shoulders. There can be little doubt that circumstances conspired, in the case of A., to give a certain largeness to his barbaric conceptions, which made him a most formidable foe to the civilization of Europe.

**ATTLEBOROUGH**, a t. in Bristol co., Mass., 31 m. s.e. of Boston, on the Boston and Providence railroad; pop. of township, '80, 11,109. Its chief manufactures are clocks, jewelry, buttons, and printed calicoes. Mill river furnishes ample water-power.

**ATTOCK**, a t. and fort of the Punjab, on the left or e. bank of the Indus, lat. 33° 54' n., long. 72° 20' e. Pop. 2000. A. stands within the limits of the fort, which is itself a parallelogram of 800 yards by 400. The place was established by the emperor Akbar in 1581, to defend the passage of the river. In modern warfare, however, it is no longer a position of strength, being commanded by the neighboring heights. The Indus is crossed at A. by a bridge of boats.

The situation of A. is important, whether in a commercial or in a military view. It is at the head of the steamboat navigation of the Indus, being 940 m. from its mouth; while about 2 m. above it, the Cabul river, the only considerable affluent of the Indus from the w., is practicable for vessels of 40 or 50 tons to a distance of 50 miles. The valley, again, of this last-mentioned stream, presenting, as it does, the best approach to the e. and s. from Central Asia, has been the route of nearly all but the maritime invaders of India from the days of Alexander the great downwards. *Taxila*, where the Macedonians crossed the Indus, is supposed to have been the same as Attock.

**ATTORNEY**, in its general meaning, is one appointed by another to act for him in his absence, the authority for so acting being expressed by a deed called a power of attorney.

**ATTORNEY** (*ante*), one put in another's place to manage his affairs. An A. *in fact* is one formally appointed, and any person of sufficient age and understanding can be chosen. An A. *at law* is an officer of the court employed by a client to manage his cause; his business being to carry on the formal and practical work of the suit, to be true to the court, and faithful to his client; if called as a witness he may refuse to disclose matters in confidence between himself and his client. An A. may be disbarred for certain offenses.

**ATTORNEY-GENERAL**, the title by which, in England and Ireland, the first ministerial law officer of the crown is known. The A. is appointed by letters-patent. His office, powers, and duties correspond in many respects to those that belong to the lord advocate (q.v.) in Scotland, though the powers of the latter functionary are more extensive and less clearly defined. Originally, the A. was simply the king's attorney, and stood to the sovereign in the same relation that any other attorney does to his employer. The term "general" was afterwards conferred to distinguish him from attorneys appointed to represent the interests of the crown in particular courts, such as the court of wards; or from the master of the crown office, who is called the "coroner and attorney for the queen." The early history of this office is involved in obscurity. Though there can be no doubt that the crown must always have been represented by an attorney in the courts of justice, there is no trace of the existence of such an officer as the A., in the modern sense, till some centuries after the conquest. Up to a period comparatively recent, the king's serjeant was the chief executive officer of the crown in criminal proceedings, and this circumstance gave rise to various questions of difficulty as to the right to precedence of these officers respectively. These questions were set at rest in 1811, by a special warrant by the then prince Regent, afterwards king George IV., by which it was declared that both the attorney and solicitor general should have place and audience before all other members of the English bar. A similar question arose in a Scotch appeal in the house of lords in 1835, between the A. and lord advocate, which was also decided in favor of the former. The following may be enumerated as the principal duties of the A.: 1st, To exhibit informations and conduct prosecutions for crimes which have a tendency to disturb the peace of the state or endanger the constitution (see **PLEAS OF THE CROWN**); 2d, To advise the government on legal questions; 3d, To conduct prosecutions and suits relating to the revenue; 4th, To file informations in the exchequer for personal wrongs committed on any of the possessions of the crown; 5th, To protect charitable endowments in the sovereign's name, as *parens patriæ*, and, generally, to appear in all legal proceedings in which the interests of the crown are at stake. The attorney and solicitor general are two of the commissioners of patents (q.v.) *ex officio*. The powers of the solicitor general are co-ordinate with those of the A., and in the absence of the latter, or during a vacancy, the former may perform his functions in all their extent. Both usually have seats in the house of commons, and their tenure of office concurs with that of the government of which they are members. They were formerly paid by fees, but now by fixed salary.

The duchies of Lancaster and Cornwall, and the county palatine of Durham, have separate attorney-generals.

**ATTORNEY-GENERAL** (*ante*), in the United States, an officer of the cabinet, charged with the conduct of the legal business of the government. There is an A. G., or some officer having similar powers and duties, in each state.

**ATTORNEY, POWER OF**, an instrument authorizing a person to act as the agent or attorney of the person granting it. A general power authorizes the agent to act generally for the principal. A special power limits the agency to particular things. A power of attorney may be by parole, or under seal. The attorney cannot execute a

sealed instrument that will bind his principal unless his own power is given under seal. Grants of this nature are very strictly construed. Authority given to one person cannot be delegated by him to another, unless expressly set forth in the original grant. The death of the principal at once cancels a power of attorney. All conditions in the power must be strictly observed to render the attorney's action legal.

**ATTORNEYS AND SOLICITORS** are those legal practitioners who conduct litigation in courts of justice, preparing the cause for the barristers, or counsel, as they are called, whose duty and privilege it is to plead and argue on behalf of the contending parties, and who in open court have its exclusive audience. A. and S. also practice conveying, or the preparation of legal deeds and instruments, and they manage a great deal of other general business connected with the practice of the law, for which, as well as for the discharge of all their duties, they are mostly remunerated by a fixed and minute scale of charges. Theirs is, indeed, an extremely important, influential, and lucrative profession, and the well-employed attorney, and the "family solicitor," are expressions which readily suggest the idea of acute intelligence, along with high character and confidential trusts seldom abused.

They are called *A.*, as practitioners in the courts of common law, because the attorney is one who is put in the place, stead, or *turn* of another. Formerly, when prosecuting or defending, suitors were obliged to appear *personally* in court; but now, on principles of convenience, A. may represent, and can often prosecute or defend any action or suit in the absence of the parties. They are called *S.* in the courts of chancery, according theoretically to the more gentle (but not less absolute) compulsion of equity. *S.* also is the name usually given to this profession when they transact family or other general business out of court, and in their own chambers. A. and S. are admitted by the superior courts, of which, therefore, they are officers, having many privileges as such, and they are, in consequence, peculiarly subject to the censure and control of the judges.

The statutes relating to this branch of the legal profession being numerous and complicated, were amended and consolidated by the 6 and 7 Vict. c. 73, etc., and 33 and 34 Vict. c. 28. No person shall act as an attorney or solicitor in any court of civil or criminal jurisdiction, or in any court of law or equity in England or Wales, unless he shall have been admitted, enrolled, and be otherwise duly qualified according to the provisions of the act. And it has been decided that the person who acts as an attorney without being properly qualified, is liable to be indicted for a misdemeanor. There is an exception, however, to the rule of admission as stated, contained in a subsequent act, the 7 and 8 Vict. c. 101, s. 68, which provides that clerks or other officers to any board of guardians under the poor laws, may commence or defend proceedings before magistrates, in special or petty sessions, or out of sessions, without being qualified as attorneys. And by the 20 and 21 Vict. c. 39, facilities are afforded for the admission and enrollment in England of A. and S. of those colonial courts where the English system prevails.

To entitle a person to admission as an attorney and solicitor under 23 and 24 Vict. c. 127, and 6 and 7 Vict. c. 73, it is required, first, that he shall have served—having been duly bound by contract in writing so to do—with some practising attorney or solicitor in England or Wales, a clerkship of five years; or—if a barrister, advocate, W.S., or S.S.C., or graduate of Scotch or Irish university, or of Cambridge, Oxford, Dublin, Durham, or London—a clerkship of three years. In some cases, four years' service are allowed. He must now pass a preliminary examination in general knowledge, as well as occasional examinations in legal subjects during his articles. The judges now have large controlling and dispensing powers as to the articles, service, fitness, and capacity to act; and the judges (or master of the rolls, as the case may be), upon being satisfied by such examination, or by the certificates of examiners appointed by them, of the competency of any candidate for admission, shall administer to him such oath as specified in the act, viz., "that he will truly and honestly demean himself in practice," and also the oath of allegiance; and after such oaths, shall cause him to be admitted as an attorney of the said courts of law at Westminster, or as solicitor of the high court of chancery. It is moreover enacted, that there shall be a registrar of A. and S., whose duty it shall be to keep an alphabetical list or roll of all A. and S., and to issue certificates as to persons who have been duly admitted and enrolled; and the duties of this office are by the act committed to the "incorporated law society," until some person shall be appointed in their room. Such a certificate from the registrar, of due admission and enrollment, must be produced to the proper authorities, by any person desirous of practicing as an attorney or solicitor, before he can obtain the stamped certificate required by the stamp act, 33 and 34 Vict. c. 97, authorizing him to practice for the ensuing year; and in order to obtain such registrar's certificate, a declaration in writing, signed by the attorney desirous of practicing, or by his partner, or in some cases by his London agent, containing his name and address, the courts of which he is an admitted attorney or solicitor, and the date of his admission, must be delivered to the registrar. And if any attorney or solicitor shall practice in any of the courts aforesaid, without having obtained a stamped certificate for the current year, he shall be incapable of maintaining any action or suit to recover his fees, and be guilty of a contempt of court, and subject to fine.

The same statute also contains the following regulations, among others of less general information: That no attorney or solicitor shall have more than two clerks, bound by contract in writing, at one and the same time; nor any such clerk after he shall have left off business. That all persons admitted as A. of one of the superior courts of law at Westminster may, upon production of a certificate thereof, be admitted in any other court of law in England or Wales, upon signing the roll of the same; and that persons admitted as S. in the high court of chancery may in like manner obtain their admission in all other courts of equity, and in the court of bankruptcy. That no attorney or solicitor, who shall be a prisoner in any jail or prison, may commence or defend any action, suit, or proceeding in law, equity, or bankruptcy; or maintain any action for fees for business done during such his confinement; and that no practicing attorney or solicitor shall be a justice of the peace in England or Wales, except in counties or towns corporate having justices by charter or otherwise. And that no attorney or solicitor shall commence an action or suit for his fees or charges in respect of any business whatever, until after the expiration of one calendar month after a bill of his costs and charges, signed by such attorney or solicitor, shall have been delivered to the party to be charged; and such party may, on a proper application, obtain an order for referring such bill to be taxed; and for staying all proceedings to recover the amount thereof in the mean time. An order may also be obtained directing an attorney or solicitor to deliver his bill (when he has not done so); and also an order for his delivering up, upon payment of what is due, all deeds, papers, and documents in his possession or power touching the business in such bill comprised. Attorneys may now, under the act 33 and 34 Vict. c. 28, enter into special agreements with their clients as to their remuneration. But this agreement, as regards suits and actions, must be deemed by the taxing officer or a court to be reasonable and fair. They may now also make it one of the stipulations that they shall not be liable for negligence. But they are still prohibited from stipulating for payment only in the event of success.

The position of A. and S. in Ireland, like the system of law and practice in that country generally, is so like that of the same profession in England, that it is unnecessary here to give any details respecting them.

The corresponding professional class in Scotland was, up to the year 1874, composed of several distinct bodies called writers to the signet, and solicitors before the supreme courts, who had the exclusive right to practice before the court of session; and of procurators, whose practice was confined to their own sheriff courts. The unsatisfactory relations existing between these bodies led to a revision of the law, which was embodied in the law agents' act of 1873 (36 and 37 Vict. c. 63). No person was thereafter entitled to be admitted a law agent in Scotland except under the new regulations, and all enrolled law agents were to have the right, on payment of proper stamp-duties, to practice in any court of law in Scotland. Applicants for future admission are to be apprenticed for five years with a practicing law agent; but advocates, English barristers, and attorneys are to serve only three years, as also graduates of a university. The court of session appoints examiners. Any enrolled law agent may be admitted to practice in the court of session. Law agents acting for the same client may lawfully agree to share profits and qualify their mutual liability. Existing societies of procurators may admit members as they see fit, but any agent admitted under the act need not become a member of such society.

**ATTRACTION** is the general name for the force or forces by which all bodies, from the minutest particles to the largest planets, suns, and systems of suns, tend to approach, or are *drawn towards* (*ad*, to; *tractus*, drawn) one another, and when in contact, are held together. The term is generic, embracing a vast variety of facts, which are subdivided under 5 heads or species of A. These are: 1. gravitation; 2. cohesion; 3. adhesion; 4. chemical affinity; 5. the attractions of electricity, magnetism, etc. See **GRAVITATION**, **COHESION**, etc. Attempts have been made to deduce all these phenomena from one principle of A., modified by an opposing force of repulsion, but as yet without success. Still less can they be explained by assuming only *one* force—A. alone, or repulsion alone—for this, too, has been attempted. The idea of an attractive force acting as the bond of the universe was first introduced as a scientific hypothesis by Newton, and was violently combated by Leibnitz and others.

**ATTRIBUTE**, in the fine arts, is a species of symbol, consisting of a secondary figure or object accompanying the principal figure—as the trident of Neptune, or the owl of Minerva. Attributes serve to mark the character meant, and add to the significance of the representation. The necessity of using them lies in the limited means of expression possessed by the formative arts. Attributes may be either essential or conventional. Essential attributes have some real relation or resemblance to the object or idea to be expressed; and are often such as could stand alone as symbols—as the bee, representing diligence. Attributes, in the strictest sense, and as distinguished from symbols, are such as are significant only in connection with a figure, to which they in a manner belong; e.g., the wings of genii, the finger on the mouth of Harpocrates. The last is an example of an accidental or conventional A., of which kind are also the *anchor*, to express hope; the *cross*, faith. Common attributes in Christian art are—the harp for king David, and writing materials for the evangelists, especially St. John.

**ATTRIBUTE**, in logic, is used to denote the opposite of substance. The latter is considered to be self-existent, while the former can only be conceived as possessing a dependent existence. Attributes are commonly said to belong to substances. Thus, wisdom, holiness, goodness, and truth are termed attributes of God, who is Himself regarded as the substance in which they inhere; in the same way, whiteness is called an A. of snow.

**ATTUCKS, CRISPUS**, an Indian mulatto, of Framingham, Mass., killed Mar. 5, 1770, in the "Boston massacre." There had been several collisions between the people and the soldiers, in one of which A. headed a party in King street, now State street. He seized the bayonet of a soldier and knocked him down; a volley was fired, and A. was the first to fall. There was a great funeral in Faneuil hall, and the incident was for some time annually commemorated, serving well the purposes of the approaching revolution.

**ATWATER, LYMAN HOTCHKISS, D.D.**, b. Conn., 1813; a graduate of Yale, and tutor and theological student there. He has been pastor of a Congregational church in Fairfield, Conn., and professor of mental and moral philosophy, and of logic and moral and political science in the college of New Jersey. In 1869, he became editor of the *Princeton Review*. He is the author of a *Manual of Logic*, and a frequent writer for periodicals.

**ATWOOD'S MACHINE**, an instrument for illustrating the relations of time, space, and velocity in the motion of a body falling under the action of gravity. It was invented by George Atwood or Attwood, a mathematician of some eminence, who was b. in 1745, educated at Cambridge, became fellow and tutor of Trinity college in that university, published a few treatises on mechanics and engineering, and died in 1807. It is found that a body falling freely, passes through 16 ft. in the first second, 64 ft. in the first two seconds, 144 ft. in the first three seconds, and so on. Now, as these spaces are so large, we should require a machine of impracticable size to illustrate the relations just mentioned. The object of A. M. is to reduce the scale on which gravity acts without in any way altering its essential features as an accelerating force. The machine consists essentially of a pulley, P (see fig. 1), moving on its axis with very little friction, with a fine silk cord passing over it, sustaining two equal cylindrical weights, *p* and *g*, at its extremities. The pulley rests on a square wooden pillar, graduated on one side in feet and inches, which can be placed in a vertical position by the leveling-screws of the sole on which it stands. Two stages, A. and B, slide along the pillar, and can be fixed at any part of it by means of fixing-screws. One of these stages, A, has a circular hole cut into it, so as to allow the cylinder, *p*, to pass freely through it; the other is unbroken, and intercepts the passage of the weight. A series of smaller weights, partly bar-shaped,

Atwood's machine.

partly circular, may be placed on the cylinders in the way represented in figs. 2 and 3. A pendulum usually accompanies the machine, to beat seconds of time. The weight of the cylinders, *p* and *g*, being equal, they have no tendency to rise or fall, but are reduced, as it were, to masses without weight. When a bar is placed on *p*, the motion that ensues is due only to the action of gravity upon it, so that the motion of the whole must be considerably slower than that of the bar falling freely. Suppose, for instance, that *p* and *g* are each  $7\frac{1}{2}$  ozs. in weight, and that the bar is 1 oz., the force acting on the system—leaving the friction and inertia of the pulley out of account—would be  $\frac{1}{15}$  of gravity, or the whole would move only 1 foot in the first second, instead of 16. If the bar be left free to fall, its weight or moving force would bring its own mass through 16 ft. in the first second; but when placed on *p*, this force is exerted not only on the mass of the bar, but on that of *p* and *g*, which is 15 times greater, so that it has altogether 16 times more matter in the second case to move than in the first, and must, in consequence, move it 16 times more slowly. By a proper adjustment of weights, the rate of motion may be made as small as we please, or we can reduce the accelerating force to any fraction of gravity. Suppose the weights to be so adjusted that under the moving force of the bar or circular weight the whole moves through 1 in. in the first second, we may institute the following simple experiments: *Experiment 1*.—Place the bar on *p*, and put the two in such a position that the lower surface of the bar shall be horizontally in the same plane as the 0 point of the scale, and fix the stage A at 1 inch. When allowed to descend, the bar will accompany the weight, *p*, during one second and for 1 in., when it will be arrested by the stage A, after which *p* and *g* will continue to move from the momentum they have acquired in passing through the first inch. Their velocity will now be found to be quite uniform, being 2 in. per second, illustrating the principle that a falling body acquires, at the end of the first second, a velocity per second equal to twice the space it has fallen through. *Exp. 2*.—Take, instead of the

bar, the circular weight, place the bottom of  $p$  in a line with the 0 point, and put the stage B at 64 in. Since the weight accompanies  $p$  throughout its fall, we have in this experiment the same conditions as in the ordinary fall of a body. When let off, the bottom of the cylinder,  $p$ , reaches 1 in. in 1 second, 4 in. in 2 seconds, 9 in. in 3 seconds, 16 in. in 4 seconds, 25 in. in 5 seconds, 49 in. in 7 seconds, and 64 in. in 8 seconds—showing that the spaces described are as the squares of the times. *Exp. 3*—If the bar be placed as in *exp. 1*, and the stage A be fixed at 4 in., the bar will accompany the weight,  $p$ , during 2 seconds, and the velocity acquired in that time by  $p$  and  $g$  will be 4 in. per second, or twice what it was before. In the same manner, if the stage A be placed at 9, 16, 25, etc. in., the velocities acquired in falling through these spaces would be respectively 6, 8, 10, etc. in.—2 in. of velocity being acquired in each second of the fall. From this it is manifest that the force under which bodies fall is a uniformly accelerating force—that is, adds equal increments of velocity in equal times. By means of the bar and the stage A, we are thus enabled to remove the accelerating force from the falling body at any point of its fall, and then question it, as it were, as to the velocity it has acquired.

ATYS, ATTIS, or ATTES, a beautiful shepherd of Phrygia, son of Nana. Cybele loved him, and made him her priest, on condition that he should preserve entire chastity; but he transgressed with the daughter of a river god, for which offense Cybele made him insane, in which condition he deprived himself of further temptation to unchastity. He was about to kill himself when Cybele changed him into a fir-tree, which she made sacred to herself, and decreed that all her priests thereafter should be eunuchs. Like many other myths, this one is supposed to represent the successive death and regeneration of nature by the changes of the seasons. In art, A. is represented as a shepherd with crook and flute. He was worshiped with the goddess in Cybele's temples.

AUBAGNE (anc *Albania*), a t. of the dep. of Bouches-du-Rhône, France, stands on the Huveaune, 9 m. e. from Marseilles, with which it is connected by railway. It is built with some regularity and elegance. The ancient town stood on a hill, at the base of which the present town is situated. It was the capital of the Albicii, who were subdued by Julius Cæsar. The castle, once of great strength, is now in ruins. The church was founded in 1164. This town is a place of considerable activity, manufacturing pottery, tiles, paper, etc. It has also tanneries and distilleries. Pop. '76, 5087.

AUBE, the name of a river and a department of France. The river A. is a tributary of the Seine, rises near Pralay, on the plateau of Langres; flows in a n.w. course by Rouvres, La Ferté, Bar, and Arcis; and falls into the Seine at Pont-sur-Seine, after a course of 90 miles.—The department of A., which occupies the southern part of the old province of Champagne, and a small portion of Burgundy, is bounded on the n. by the Marne, on the e. by the Haute-Marne, on the s.w. by the Yonne, and on the n.w. by the Seine-et-Marne. The eastern part belongs to the basin of the A.; the western, to the basin of the Seine. Area, 2310 sq. m. Pop. '76, 255,217. The climate is mild, moist, and changeable; but on the whole healthy. A great portion of the area is arable land. The n.e. is chiefly applied to pasturage; but the s.e. is far more fertile, rich in meadowland and forest, and producing grain, hemp, rape, hay, timber, and wine. In minerals, the department possesses little besides limestone, marl, and potters' clay. The chief manufactures are woolen cloth, cotton and linen goods, ribbons and stockings, leather, parchment, etc. The sausages and bacon of A. have long been famous. *Troyes* is the capital of the department.

AUBENAS, a t. in France, in the department of Ardèche. It is picturesquely situated on the right bank of the Ardèche, 14 m. s.w. from Privas, in the middle of the volcanic region of Vivarais. It looks well from a distance; but the streets, with the exception of one traversed by the diligence, are narrow and crooked, the squares small, and the houses very irregularly built. An old and rapidly decaying wall, flanked with towers, girds the town, which contains an ancient castle. A. is the principal mart for the sale of chestnuts and silk in the department. Several important fairs are also held here. It possesses in addition manufactures of silk, paper, cotton, coarse cloths, leather, etc., the machinery of the mills being driven by water. Pop. '76, 5082.

AUBER, DANIEL FRANÇOIS ESPRIT, a composer of operas, was b. at Caen in Normandy, Jan. 29, 1784. His father was a printseller in Paris, and being desirous that his son should devote himself to business, he sent him to London to acquire a knowledge of the trade. But his irresistible passion for music obtained the upper hand, and after a short stay he returned to Paris. Among his earliest compositions may be noticed the *concertos* for the violoncello, ascribed to Lamare the violoncellist; the concerto for the violin, played by Mazas with great applause at the conservatory of music, Paris; and the comic opera, *Julie*, with a modest accompaniment for two violins, two altos, and a bass. These works were very successful; but A., aspiring to greater things, now devoted himself to a deeper study of music under Cherubini, and wrote a mass for four voices. His next work, the opera *Le Séjour Militaire* (1813), was so coldly received that A. grew disheartened, and resolved to abandon the idea of reaching eminence as a musical composer. However, the death of his father compelled him to be dependent on his own resources; and in 1819

appeared *Le Testament et les Billets-doux*, which was also unsuccessful; but in *La Bergère Châtelaine* he laid the foundation of his subsequent fame. In all these early essays, as well as in the opera of *Emma* (1821), he displayed an original style; but afterwards he became an imitator of Rossini, and disfigured his melodies with false decorations and strivings for effect. All his later works, excepting *La Muette de Portici* (Masaniello), produced in 1838, are written with an assumed mannerism, but in a light and flowing style, with many piquant melodies which have made the tour of Europe. The operas *Leicester* (1832), *La Neige* (1833), *Le Concert à la Cour*, and *Léocadie* (1834), *Le Mignon* (1835), *Fiorella* (1836), *La Fiancée* (1839), *Fra Diavolo* (1830), were followed by a series of lighter works: *L'Elisir d'Amour*, *Le Dieu et la Bajadère*, *Les Faux Monnayeurs*, etc.; the later operas, *Gustave ou le Bal Masqué*, *Le Lac des Fées*, *Le Cheval de Bronze*, *Les Diamants de la Couronne*, *La Part du Diable*, *La Sirène*, and *Haydée*, exhibiting the same popular qualities as their predecessors; but their interest is evanescent, as they are deficient in depth of thought and feeling. His later works are *Jenny Bell* (1855) and *Manon Lescaut* (1856). In 1842, A. was appointed director of the conservatory of music, Paris. He d. May 14, 1871.

AUBERT DU BAYET, JEAN BAPTISTE ANNIBAL, 1759-97; a French general who served with Rochambeau in the American revolution. He was in the French assembly in 1791; commanded at the siege of Metz in 1793; was minister of war in 1795, and minister to Constantinople, where he d., in 1797.

AUBERVILLIERS, a village of France, near Paris; pop. 11,694. There was once a picture of the Virgin in the village church which was thought to possess miraculous powers, and the church was known as Notre Dame des Virtus. A fort built in 1842 stands east of A.

AUBIGNÉ, MERLE D'. See MERLE D'AUBIGNÉ.

AUBIGNE, THEODORE AGRIPPA D', a famous French scholar, was b. on 8th Feb., 1550, near Pons in Saintonge. At an early period, he exhibited a remarkable talent for the acquisition of languages. Although come of a noble family, he inherited no wealth from his father, and consequently chose the military profession. In 1567, he distinguished himself by his services to the Protestant cause, and was subsequently rewarded by Henry IV., who made him vice-admiral of Guienne and Bretagne. His severe and inflexible character frequently embroiled him with the court; and after the death of Henry, he betook himself to Geneva, where he spent the remainder of his life in literary studies. He d. Apr. 29, 1630.

His best known work is his *Histoire Universelle*, 1550-1601 (Amsterdam, 1616-1620), which had the honor of being burned in France by the common hangman, as also his *Histoire Secrète, écrite par lui-même* (1721). A. was possessed of a spirit of biting satire, as is proved by his *Confession Catholique du Sieur de Sancy*, and his *Aventures du Baron de Freneste*.

AUBIN, a t. 16 m. n.e. from Villefranche, department of Aveyron, France; pop. '66, 8863. It is in the midst of a coal region of great productiveness.

AUBREY, JOHN, 1625-97; an English antiquary. He was a diligent collector of old documents, and left some valuable works of his own. He wrote *Natural History and Antiquities of Sussex*, and *Letters written by Eminent Persons of the Seventeenth and Eighteenth Centuries*, giving in the latter work much biographical matter concerning English poets.

AUBRY DE MONTDIDIER, a French knight who lived in the times of Charles V., and, as tradition says, was assassinated in the forest of Bondy by Richard de Macaire in 1371. The latter became suspected of the crime on account of the dog belonging to the deceased Aubry invariably displaying towards him the most unappeasable enmity. Macaire was therefore required by the king to fight with the animal in a judicial combat, which was fatal to the murderer. This tale was afterwards, under the titles of *Aubry's Dog*, *The Wood of Bondy*, *The Dog of Montargis*, frequently acted, the "dog" always gaining the greatest share of applause! After being performed with success at Vienna and Berlin, it was appointed to be played at the Weimar theater, of which Goethe was the manager; but the poet resigned his office before the dog made his *début*.

AUBURN, the name of 23 places in the United States. Of these, the most important is in the state of New York, on the railway between Albany and Buffalo. It is in lat. 42° 53' n., and long. 76° 40' w. Pop. '70, 17,225. The outlet of Owasco lake, which is 2 or 3 m. to the n., flows through the town, furnishing a water-power which is employed in mills of various kinds, and in manufactures of wool, cotton, carpets, iron, and paper. A. abounds in seminaries of education, but is perhaps most widely known for its state prison. The building itself is a large structure of stone; while the wall that incloses it is 3000 ft. long, and from 12 to 35 ft. high. The number of convicts usually exceeds 1000, and their labor is said to be generally equal to the expenses of the establishment.

AUBURN, a village and seat of justice of Androscoggin co., Me., on the Androscoggin and little Androscoggin rivers and the Maine Central railroad, 34 m. from Portland; noted for cotton and shoe manufactures. Pop. '76, 6169.

AUBUSSON, a t. of the department of Creuse, France, 125 m. w. from Lyon. It is picturesquely situated on the Creuse, in a narrow valley or gorge, surrounded with moun-

tains and rocks. It is a well-built town, consisting chiefly of one broad street. It is celebrated for the manufacture of carpets, which is said to have been introduced by the Arabs or Saracens, who settled here in the 8th century. Tanning and dyeing are carried on, and there is some trade in wine. Pop. '76, 6424.

**AUBUSSON, PIERRE D'**, grand master of the order of St. John of Jerusalem, was b. in 1423 of an ancient and noble French family. His early history is imperfectly known, but he is said to have borne arms, when very young, against the Turks in the wars in Hungary, and to have distinguished himself by the mingled zeal and valor he displayed. Here he acquired that intense antipathy to the "Infidels" which subsequently animated his whole public career, and gave a peculiar bias to his ambition. Having returned to France, he accompanied the dauphin in his expedition against the Swiss, and was instrumental in securing their defeat at the battle of St. Jacob near Basle. His mind, however, constantly reverted to the ominous encroachments in the east of the dreaded Mussulman, and at last he resolved to betake himself to Rhodes, where he enrolled himself among the brotherhood of Christian knights. Now his history emerges into clear light, and assumes a very considerable importance. He swept the Levant, and chastised the pirates who prowled perpetually among the Greek isles, obtaining the approbation and regard of the grand master. In 1458, by his ardor and address he succeeded in forming a kind of Christian league between the French monarch and Ladislaus, king of Hungary, against Mohammed II. This was the great aim of A.'s life, the "idea" which continually possessed him—viz., the necessity of a vast organization of all Christendom to overthrow the power of the Turks. Step by step, through long years, he won his way to supreme power in his order. In 1476, he was elected grand master. It was a critical period for the civilization and religion of Europe. Constantinople had recently been taken and the Byzantine empire destroyed by Mohammed II. Every day the conqueror marched further w. Thrace, Macedonia, central Greece, Servia, Wallachia, Bosnia, Negropont, Lesbos, and the islands of the Adriatic had been successively conquered by him. Proud of his rapid glories, and sustained by an immense prestige, the sultan threatened to dictate terms from Rome to the entire west. Rhodes, however, stood in his way, the sentinel isle of Christianity, on the great maritime route between Asia and Europe. Mohammed saw that the battle between the two faiths must begin here; and in May, 1480, a Turkish army of 100,000 men, commanded by a Greek renegade, Palæologos, landed in the island, and commenced to besiege the town. Two desperate assaults were made. The Turks, however, were compelled to desist, and sailed away, leaving 9000 dead. Mohammed was enraged, and planned a second expedition, which was interrupted by his death at Nicomedeia in Asia Minor, May, 1481. After this, A. took a leading part in the religious diplomacy of the papal court, and received from the pontiff many honors and privileges. Meanwhile, he exerted himself to improve and strengthen the internal organization of the brotherhood, enriching the diplomatic code of his order with several wise statutes and regulations relative to the election of dignitaries, the finances, etc., and exciting great admiration throughout Christendom. In 1501, he was appointed generalissimo of the forces of the German emperor, the French king, and the pope, against the Turks; and, in spite of his great age, he enthusiastically entered on his duties, and sailed to attack Mitylene; but the expedition failed on account of the discordant aims which the various belligerents had in view. Broken by disappointment and vexation, the grand master returned, and died at Rhodes in July, 1503, at the age of 80.

**AUCH**, the capital of the department of Gers, in the s. of France, situated on the river Gers, 42 m. w. of Toulouse, lat. 43° 38' n., long. 0° 35' e. Pop. '76, 12,145. It is the seat of an archbishop, and possesses a museum of natural science, together with an old and beautiful cathedral, the painted windows of which are greatly admired. Its chief articles of trade are woolen and cotton stuffs, fruits, wine, and brandy.

In ancient times, it was called *Elimberis*; and at a somewhat later period took its name from the Auscii, whose chief town it was. In the 8th c., it became the capital of Gascony, and later, of the county of Armagnac.

**AUCHE NIA** (from the Gr. *auchen*, the neck), a genus of ruminating quadrupeds, of which the llama (q.v.) and the alpaca (q.v.) are the best known. The genus is exclusively South American; indeed, the species occur only on the lofty ranges of the Andes. They are nearly allied to the camels, and may be regarded as their representatives in the zoology of America. They form, along with them, the family *camelidae* (see CAMEL), and were included by Linnæus in the genus *camelus*. They agree with the camels in certain important anatomical characters, particularly in the structure of the stomach; and also resemble them very much in general form, in the long neck, small head, prolonged and movable upper lip, and small apertures of the nostrils. They differ from them partly in dentition, and partly in the more cloven feet and movable toes. The nails, also, are stronger and curved, and each toe is supported behind by a pad or cushion of its own; by all which the feet are admirably adapted for the rocky heights which the animals inhabit. The genus A. is by some naturalists called *llama*.

**AUCHMUTY, ROBERT**, a lawyer of Scotch descent, b. in England, but a settler in Massachusetts in early life. He was judge in admiralty in 1733, and in 1741 went to

England as colonial agent, where he published a pamphlet on the importance of Cape Breton to England, with suggestions for its capture. He died in Boston, April, 1750.

**AUCHMUTY, ROBERT**, son of Robert the lawyer, also a lawyer in Massachusetts, and admiralty judge in 1767. He was associated with John Adams in the defense of Capt. Preston, who was one of the British officers in the "Boston massacre." A. was a strong royalist, and went to England, where he d., 1788. Some of his letters to people in England, which were sent to the colonies by Franklin, created much excitement.

**AUCHMUTY, SAMUEL, D.D.**, 1722-77; son of the first Robert. He graduated at Harvard, and took priest's orders in England. The society for the propagation of the gospel sent him to New York as assistant minister of Trinity parish, and in 1764 he had charge of all the Episcopal churches in the city. When the American revolutionists took possession of the city, he was forbidden to read prayers for the king, but he continued until troops invaded the church and threatened force. He locked the church and chapels, and fled to New Jersey with the keys, ordering that no church should be opened until the forms of prayer could be read without abridgment. A few months later the British took the city, and A. worked his way through the American lines, with great difficulty, just after his church and all its records had been destroyed by fire. He preached only one more sermon, in St. Paul's, was taken ill from exposure and hardship, and died a few days later.

**AUCHMUTY, Sir SAMUEL**, 1758-1822; son of Rev. Samuel. He was a graduate of King's (Columbia) college, and went into the English service in 1776; was in the battles of Brooklyn and White Plains, and served in three campaigns. Having risen to a captaincy, he served in India from 1783 to 1796, participating in the siege of Seringapatam. In Egypt, in 1800, he was Abercrombie's adjutant-general; and a brigadier-general in South America, where, in Feb., 1807, he took by assault the fort and city of Montevideo, for which parliament voted him thanks. In 1810, he commanded in the Carnatic, and the next year reduced the Java settlements, and was again voted thanks. In 1813, he held the chief command in Ireland.

**AUCHTERAR DER**, a village in the s.e. of Perthshire, on the w. side of the Scottish Central railway. Pop. '71, 3795, chiefly employed in cotton-weaving. The popular opposition to the presentee to the church of A. originated (1839) the struggle which ended in the secession from the church of Scotland and the formation of the free church in 1843.

**AUCKLAND**, the most northern of the provinces of New Zealand, includes fully a half of North island, and is about 400 m. long by 200 wide, at its greatest breadth. A. has a coast-line of nearly 1200 m.; and is, in addition, remarkable for its rivers, which serve as carriage-ways for the produce of the interior. Pop. '75, 79,104. There are three almost natural divisions of this province: North Peninsula, East Coast, and the Waikato Country—the latter two being mainly in the hands of the natives. Gold, copper, tin, iron, coal, and other minerals exist in A. The value of the gold exported from 1857 to 1875 was £3,567,634. A. is very rich in timber, the most important tree being the kauri pine. The fossil gum found wherever the kauri forests have been, is an important article of export. The government grants the right, at a low price, to cut the *phormium* or New Zealand flax which grows on waste districts. The rearing of live-stock is more attended to than the cultivation of cereals. In 1875, 1,543,925 lbs. of wool, value: £94,290, were exported. The total value of exports in 1875 was £712,754. The principal agricultural products are wheat, oats, barley, hay, and potatoes.

**AUCKLAND**, the second city of New Zealand, capital of the above named province, in lat. 36° 50' s., and long. 174° 50' e., was, till 1865, capital of New Zealand, when the seat of government was transferred to Wellington, the chief city of the province of the same name. A. is distant from Sydney 1236 m.; from Melbourne, 1650; and keeps up steam communication with these two cities. Picturesquely situated, its position for commerce is also excellent, as, in addition to its harbor at Waitemata, it possesses also a western harbor, the Manakan, 6 m. distant. There is a wharf 1690 ft. in length. It is surrounded by numerous thriving villages, with several of which it is connected by railway. A. contains a well laid out botanical garden, and shows numerous public buildings, government house, barracks, etc. It supports three daily papers. About 170 sailing vessels and 20 steamers are registered as belonging to A. A. was founded in 1840. Pop. '75, 13,142; but including suburban districts, about 23,200. The temperature appears to be singularly equable. The mean of the coldest month is 51° F., and that of the warmest 68°. The annual rain-fall is 45½ in.; and the days of rain-fall average 100.

**AUCKLAND, BISHOP**, a small t. in the middle of the co. Durham. Pop. '71, 8736. It stands on an eminence, 140 ft. above the plain of the wear. A. contains the abbey-like palace of the bishop of Durham.

**AUCKLAND, Lord, WILLIAM EDEN**, an able statesman and diplomatist, third son of Sir Robert Eden, Bart., of West Auckland, Durham, b. in 1744, educated at Eton and Oxford, and called to the bar in 1768. In 1772, he was appointed under-secretary of state, and afterwards filled the positions of a lord of trade, a commissioner to treat with

the insurgent colonists of North America, chief secretary to the lord-lieutenant of Ireland, minister-plenipotentiary to France (concluding a commercial treaty with that country, 1786), ambassador to Spain, ambassador to Holland, and joint-postmaster-general. In 1788, he was created an Irish peer as baron A.; and in 1793 he was made a British baron. He d. suddenly, May 28, 1814. A. was the author of the *Principles of the Penal Law* (1771, 8vo); *Remarks on the Apparent Circumstances of the War* (1795); *Speech on the Income-tax* (1799); *Speech in Support of the Union with Ireland* (1800); and other pamphlets.

**AUCKLAND**, Earl of, GEORGE EDEN, governor-general of India, son of William Eden, lord Auckland, b. Aug. 25, 1784, succeeded his father in 1814 as lord A.; and in Nov., 1833, joined earl Grey's administration. In July following, in viscount Melbourne's first ministry, he became first lord of the admiralty. He vacated that office in Nov. of the same year, but was appointed to it again in 1846. In 1835, he went out to India as governor-general. He returned to England in 1841, and died unmarried, Jan. 1, 1849.

**AUCKLAND ISLANDS**, a group of islands to the s. of New Zealand, being about the 51st parallel s., and the 167th meridian e. The largest of them measures 30 m. by 15. It has two good harbors, and is covered with the richest vegetation. The A. I. are valuable chiefly as a whaling station, being at the confluence, as it were, of the Pacific and Southern oceans.

**AUCTION** (Lat. *auctio*). The character of this convenient mode of offering property for sale is correctly indicated by the name. The Latin word *auctio* means "an increasing or enhancement," and an A. is an arrangement for increasing the price by exciting competition amongst purchasers. What is called a *Dutch auction*, in which the usual mode of proceeding is reversed, the property being offered at a higher price than the seller is willing to accept, and gradually lowered till a purchaser is found, is thus no A. at all in the original and proper sense of the term. The A. is of Roman origin, and is said to have been first introduced for the purpose of disposing of spoils taken in war. Such sales were said to take place *sub hastâ* (under the spear), from the custom of sticking a spear into the ground, probably to attract purchasers to the spot. "Conditions of sale," or "articles of roup," as they are called in Scotland, constitute the terms on which the seller offers his property, and form an integral part of the contract between seller and purchaser. The contract is completed by the offer or bidding on the part of the purchaser, and the acceptance by the seller or his representative, which is formally declared by the fall of the auctioneer's or salesman's hammer, the running of a sand-glass, the burning of an inch of candle (hence the term "sale by the candle"), or any other means which may have been specified in the conditions of sale. These conditions or articles ought further to narrate honestly and fully the character of the object or the nature of the right to be transferred, to regulate the manner of bidding, prescribe the order in which offers are to be preferred, and to name a person who shall be empowered to determine disputes between bidders, and in cases of doubt to declare which is the purchaser. Before the sale commences, these conditions, which are executed on stamped paper, are read over, or otherwise intimated to intending purchasers. The conditions, thus published, cannot be controlled by any verbal declaration by the auctioneer. The implied conditions, which, in addition to those thus expressed, are binding on the seller and purchaser in all auctions, are: 1. That the seller shall not attempt to raise the price by means of fictitious offers, but shall fairly expose his goods to the competition of purchasers; and 2. That the purchasers shall not combine to suppress competition. Much doubt has arisen as to the lawfulness of biddings for the exposor. The exposor may set a price below which the thing is not to be sold, which is best and most openly done by fixing an upset price, or he may expressly reserve to himself a power to offer. "But if the sale is declared to be without reserve, or at the pleasure of the company, the plain meaning and effect of this, even in England, is held to be to bar all biddings in behalf of the seller." "In Scotland, the law condemns absolutely such interference." It has been said that if there be no upset price, and no agreement to sell at the pleasure of the company, the owner may bid, but that is not law, or is at least too broadly laid down." Bell's *Commentaries*, i. 97, edit. 1858. The A. duties were repealed by 8 and 9 Vict. c. 15.

**AUCTIONEER**, the person who conducts an auction (q.v.). The A. is in a certain sense the agent both of seller and purchaser, and by the fall of his hammer, or by writing the purchaser's name in his book, he binds him to accept the article sold at the price indicated. The A. may also, and frequently does, act as agent for absent purchasers, or for persons who have instructed him to make biddings for them during the sale. In both cases, however, the purchaser must be *bona fide*, otherwise the A. would himself become a "puffer." As to the circumstances in which he may bid for the seller, see **AUCTION**. Where the A. declines or omits to disclose the seller's name, he undertakes his responsibilities to the purchasers. To the seller, again, he is responsible for ordinary skill, assiduity, and prudence. Every A. pays an annual duty of £10 to government for his license, which must be renewed on the 5th July; though there are certain judicial sales which may be conducted by bailiffs without license (see 19 Geo. III. c. 56, s. 3, and later stamp acts).

**AUCUBA**, a genus of plants of the natural order *cornaceæ* (q.v.), of which the only known species is *A. japonica*, an evergreen shrub resembling a laurel, but with dichotomous or verticillate yellow branches, and, as seen in Europe, always with pale green leaves curiously mottled with yellow. It is dioecious, produces its small purple flowers in summer, and ripens its fruit, a small red drupe, in Mar. It is a native of China and Japan, and was originally introduced into Britain as a stove-plant, but is found to be at least as hardy as the common laurel, and is now a very common ornamental shrub, especially in the suburbs of large towns, a sort of situation for which it is particularly adapted, as it is very little liable to suffer injury from smoke. It is often called the variegated laurel. The mottled appearance of the leaf is said, however, not to belong to the plant in its ordinary natural state; but only this variety has yet been brought to Europe, and of it only the female plant.

**AUDE'US**, AUDR'US (or, according to his native Syriac name, *Udo*), the founder of a religious sect in Mesopotamia, flourished during the 4th century. He commenced by accusing the regular clergy of worldliness, impure morals, etc., and is said to have opposed to their manner of life a strict asceticism, until his conduct seemed dangerous to the welfare of the church, when he was excommunicated. His disciples, who were pretty numerous, now clung more closely to him, and he was elected their bishop. In 338 A.D., he was banished to Scythia, where he instituted a kind of rival church, and where he died about 370 A.D. Our knowledge both of his character and opinions is derived solely from inimical authorities, such as Augustine, Athanasius, etc., and is therefore to be accepted with caution. But his labors amongst the fierce barbarians in the north are acknowledged to have been beneficial, and one writer, Epiphanius, states that he ought to be considered *schismatical*, but not *heretical*. But if the leading feature of his system was, as is alleged, a decided tendency to anthropomorphism, we cannot see—according to the principles upon which the church usually proceeded—why he should not have been so called. He is said to have held that the language of the Old Testament justifies the belief that God has a sensible form—a doctrine deemed heretical in all ages of the church's history. This particular tenet took firm hold on many minds, and in the subsequent century, was widely spread through the monasteries of Egypt.

**AUDE** (*Atax*), a river in the s. of France, rises in the east Pyrenees, not far from mont Louis; flows for some time parallel to the canal of Languedoc; and falls into the Mediterranean 6 m. e.n.e. of Narbonne, after a course of more than 120 miles.

**AUDE**, a maritime department in the s. of France. It comprises some old "counties" which formerly constituted a portion of the province of Languedoc. Pop. '76, 300,065. Area, 2430 sq.m. The southern part of A. is mountainous, but the greater portion of it belongs to the valley of the lower A. and the canal of Languedoc. Its northern boundary is formed by the Black mountains, the most southerly offsets of the Cevennes. The coast is flat, with no bays or roadsteads, but several lagoons. The climate is warm, but variable. The mountains are composed of granite, while the soil of the plains is chiefly calcareous, and about the coast—where salt and soda are procured—is extremely fertile, producing cereals, olives, fruits, and wines. A. is rich in iron and coal, and mineral springs. The woolen and silk manufactures are of considerable value. There is likewise a considerable export of corn, honey, etc. The chief town is Carcassonne.

**AUDEBERT**, JEAN BAPTISTE, a distinguished French naturalist, was b. in 1759 at Rochefort; studied the arts of design and painting at Paris, and in early life attained a degree of eminence as a miniature painter. Indulging a predilection for the study of natural history, he was much employed by naturalists in painting the more rare and beautiful objects in their collections. In 1800, after having visited England and Holland for the purpose of making sketches, he published at Paris, on his own account, a splendid volume, which raised him at once to celebrity, both as a painter and author. This work, the *Histoire Naturelle des Singes, des Makis, et des Galéopithèques* (Natural History of Monkeys, Lemurs, and Flying Lemurs), was a large folio, with 62 colored plates, remarkable alike for their truth and beauty. His method of color-printing in oil, which was then novel but now common, was to dispose all the colors on one plate instead of using a separate plate for each color. His use of gold and bronze in the illustrations and letterpress was then also as new as it is attractive. In his *Histoire des Colibris, des Oiseaux-mouches, des Jacamars, et des Promérops* (Natural History of Humming-birds, Jacamars, and Promeropses), he succeeded by the same process in giving to his plates even a greater brilliancy and finish. He d. in 1800.

**AUDHUMBLA**, in Norse mythology, the cow formed at the creation from frozen vapors resolved into drops. She nourished Ymer, the huge giant made of frost and fire, from whose body the gods made the world.
